:-) Not supposed to mention MULE for some reason :-)

Mine is
Star Raiders
Alternate Reality : The City (If only to listen to title tune, which is
absolute some of the best computer music I heard)
Wizards Crown (Since I never got around to complete it ... if have time
soon, I think I want to give it another try)
Starfleet I
Bounty Bob Strikes Back

But there's a lot of games I'd miss :-/ Rescue on Fractalus, Ballblazer,
Pole Position ... oh a lot really

Must haves :
Star Raiders, MULE, Dropzone, Bounty Bob Strikes Back, Miner 2049'er, Rescue on Fractalus, Ballblazer, Koronis Rift, The Eidolon, Starfleet I, Pole Position, Datasoft version of Pac-Man (have the interludes) ... Mostly all Atari carts were very good ...

Hmmm ... Wizards Crown, Ultima series, Alternate Reality, Mr. Robot and his Robot Factory, Cavernia, The Last Starfighter/Star Raiders II ... Hmmm ... difficult to remember, but probably more pop up soon :-)

It's a lovely computer

1st - Star Raiders, Why I bought my 1st Atari Computer, a 600xl!

2nd - Star Trek by Sega is very Good. I love it when I Destroy Nomad! I'm missing the Manual, Box and the Joystick overlay!

I had Star Fleet 1 for my 800xl but I prefer it on my ST! I can completely control it on my ST's Numeric KeyPad! I wrote a review years ago! I'm good!

3rd - Silent Service is the 1st Commercial Disk Game I bought and my 1st Disk Drive was a Brand New In the Box 1050! Before Silent Service I played Submarine Commander on Cartridge by EMI Thorne Video from Kay Bee Toy & Hobby! My 3rd choice is Silent Service!

BTW, I love Simulators especially by MicroProse like Silent Service!

4th - I Love most LucasFilm Games like Eidolon, Koronis Rift, BallBlazer & Rescue on Fractulus! I love Games that use Fractal Math Like Silent Service & Rescue on Fractalus! My 4th Choice is Rescue on Fractalus!

5th - I Love many XE Game Cartridges, especially because Atari repackaged good games some formally on Disk! My 5th Choice is Star Raiders II!

6th - I know were only picking 5 but my 6th is Final Legacy by Atari! The Box says it's 3 Games in 1 and it's a simple way to Relax!

7th - One of my favourite Movies is War Games with Matthew Broderick and Ally Sheedy! I still have my VHS copy! I dont have it for the Atari by Coleco but I have EMI Thorne Video's release of Computer War. I love that the Tic Tac Toe is worked in!My 7th Game is Computer War!

I prefer Simple Games to help me relax! The more complicated work the more needed simplicity of play! Paraphrased from Captain Kirk on the Pleasure Planet on Shore Leave! I prefer an older familiar game over a new game to keep it simple, not learn a complicated new game with a big, thick manual! My 1st game is Star Raiders! I loved reading the Manual mainly because it spun a story which helped me get into the Fantasy of the story & prepared me so I could Play! "Do you want to play a game?" Quoted from War Games!

You might want to specify a little more the type of
games.
Graphics chaser, role playing, board, shootem
strategy, multi-player.

Star Raiders
Donkey Kong
Ms Pac Man
Donkey Kong jr
Shamus
Blue Max
MULE
Zybex
Rainbow Walker
Krazy Shootout
Pac Man
Pengo
Joust
Defender
Spelunker
Jumpman
Jumpman Jr
Miner 2049er
Caverns of Mars
Galaxian
Rescue on Fractalus (aka Behind Jaggi Lines)
Ball Blazer
Alternate Reality
Dig Dug
Ultima I, II
Missle Command
Gateway to Apshai
Eastern Front
Montezumas Revenge
Quasimodo
Bruce Lee
Fort Apocalpse
All the Infocom games (Zork, Hitchhikers, etc..)
Archon
Arkanoid
Gyruss

I think that should pretty much cover it... but there are even more
for example almost any Synapse game is worth trying. I suggest you
get an emulator or a SIO to PC if you use a real xl/xe and try them
all to see what you like.

Or an SIO2SD. :)

Personally, I'm also enjoying games on carts. (1) Nice to be legit
(vs. grabbing a cracked copy off an FTP site), (2) Instant load times,
no need for floppy drive or even SIO2SD. (Not the most 2-year-old-toddler
friendly devicde ;))

Hello:

I have every variation of MYDOS and have been hooked on MYDOS 4.5 for ages. I am not a power user, but still enjoy finding my collection of DOS that is out there,(for example DOS 1.0, TOP-DOS, MACH-DOS and MYDOS)
I do have FORTH, KYAN PASCAL, but love to see what "C" can do on the Atari, but is there one out there?
Curious on your favorite DOS ?

JIM

I prefer FTe/SpartaDOS. Have you seen/tried
CC65 'C' for the Atari 8-bit?
I haven't tried it, but it looks good.
You may be able to find it at:

http://ftp.pigwa.net/stuff/collections/holmes%20cd/Holmes%202/Programming/index.html

If that wraps on you, goto ftp.pigwa.net
then stuff
then collections
then holmes
then programming.
then C
```

3013. MYDOS 128K

That one probably wraps. You'll find mydos453.atr
there. I don't know what you're talking mydos453 for
130xe, I believe there is only one mydos453.
I'll try to see if it wraps. It is a bit complicated URL.

It depends on the computer and what you do with it. If you have an expanded memory XL/XE computer and/or a USD1050 then Sparta DOS is definately the way to go.

Stock 800/400 computer and drives would make MyDOS the best option.

I loved the features of SD for running a BBS but when programming a ramdisk meant a lot of crashes and lost time.

I used Lightspeed C for a little while on the Atari. C on the Atari is just OK but still isn't enough of a speed up to be a killer ap. The Atari doesn't hve the {} keys so you have to use $[ ]$ or something like that. It bothered me enough to use Speedscript which had the {} and IIRC Lightspeed which could use them.

Rick

I'm with Russ here; creation of the RAMdisk depends on the contents of your
boot disk; ie how you were configured (option 'O') when you wrote (option
'H')
the DOS files to it. I do not have an XE, but the expanded XL can boot
either
with or without the RAMdisk using MyDos 4.53/4.

WarGames is one of my favorite movies also. I have it on laserdisc. :)

They finally made sort of a sequel, called WarGames: The Dead Code. It
is a similar story, but updated to today's technology. Professor Falken
and the WOPR make appearances in it. It's not as good as the original,
but is entertaining to watch once.

Hey, my daughter actually caught one when we were playing last night!
That's the first time I've ever seen the resulting screen. One question
I have is do you have to press the joystick button, or just land on him
at just the right time?

Thanks,
Trevor

I am looking for MyDOS 128K that one or two pass duplicate disk. For
example, MSDOS copies one pass whole 1.44MB disks, use extended memory.
MyDOS copies one pass whole 90K disk, use 128K extended memory.

Like Commodore 64 with 1764 REU, adding 256K expended memory. Disk copy
program uses the REU to copy the whole disk in single drive.

I don't know if MyDOS 4.53/4 uses extended RAM or
not. You may be talking about a third party copy
disk program, which I don't know about.
There's a lot I don't know about, so maybe someone
else can set me straight.

That's is one of the things that make me give the edge to Sparta. No facts just impression that there are a lot more Rambo memory expansions then Newell. I had at least one each in my systems and I remember the problems they gave me at first. I had to edit the MyDOS ramdisk handler to work with Rambo banking and it took a while before ICD came out with RD.COM that could handle the Newell. I think Tim Patrick wrote a ramdisk handler that could check anything and everything but I don't know if it was Atari DOS only or if it can handle MyDOS.

If Jack is using dup disk then a 3rd party one would be a good choice if he can find one that uses expanded memory. I'm pretty sure at least some ignored unused sectors for quicker copies. If it is just files then he is better off doing wildcard copies to get the files unified.

3025. Atari 400 joystick ports - problem

Newsgroup: comp.sys.atari.8bit
Date: 2009-04-07 14:55:21 UTC
From: Michael <mlspera@gmail.com>
Message-ID: <7d369d79-d0eb-42c0-ae37-acdb1aa1f115@r34g2000vba.googlegroups.com>
Source record: 2264

I recently got hold of an Atari 400. There seems to be a problem with the joystick ports which are unresponsive except for firing.

I've tried two different Atari joysticks which I know are wroking fine - neither casue any movement in different games, but the fire buttons work fine. I even cleaned the contacts inside the joystick as well as in the 9-pin connector,

I tried running a basic program to read each of the ports and joystick buttons (i.e., "10 print stick(X), strig(X): goto 10"

The results: Stick(0) gives mostly "3" with an occasional 13, 6, 8, 0, and 10 thrown in. No change when stick is moved or even removed, nor when pins 1 through 4 are connected with a short jumper wire to ground. Again, pressing the joystick button works.

Stick (1) is similar to stick(0), mostly "13" witrh 0, 2, 8, and 6 appearing occasionally. Joystick button works.

Stick(2) Gives only the number 3. Joystick button works.

Stick(3) Gives only the number "13". Joystick button works,

Again, grounding any of the directional pins does not affect the result of stick(X).

I then tried measuring the DC voltage at each of the pins on the computer ports when connected to ground.

Stick(0) Pin 1: 341 mV Stick(1) Pin 1: 340 mV Stick (2)
Pin 1: 4.8 V Stick(3) Pin 1: 4.8 V
Pin 2: 340 mV Pin 2: 339
mV Pin 2: 4.8 V Pin 2 4.8 V
Pin 3: 342 mV Pin 3: 342
mV Pin 3 4.8 V Pin 3: 4.8 V
Pin 4 302 mV Pin 4: 342
mV Pin 4: 4.8 V Pin 4: 4.8 V
Pin 5: 68 mV Pin 5: 59
mV Pin 5: 4.3 V Pin 5: 4.8 V
Pin 6 4.87 V Pin 6: 4.79
V Pin 6 4.8 V Pin 6: 4.3 V
Pin 9 67 mV Pin 9: 28
mV Pin 9: 64 mV Pin 9: 67 mV

Shorting pin 7 (the +5 V supply) to ground causes a cold start of the computer.

I know the pins that are supposed to be "on" should be arounnd 5V, and the ones that are off should be around 60 mV......So it seems to me that something is definitely wrong with the first two ports on the computer, although why the other two are also unrespoonsive, even when a pin is shorted to ground is beyond me. The only reaction I get is shorting pin 6, which causes STRIG(X) to read 0.

Before I starrt poking around inside the computer, does anyone have any suggestions? Has anyone run into this problem before?

I appreciate everyones input!

Michael

Very rare for the 6520 to fail, I have only seen one go bad in the last 25 years, but I think that may be your problem. I would have a replacement on hand before I tore into the computer. Get either the 6520 or 6820 and the CMOS versions of both chips would be OK too. It could be the existing chip may just need to be reseated but 68C20s are only about $2.

One way of checking to see if it is the connector instead of the 6520 would be to test the JS fire button. The fire button is controlled by the GTIA so if those buttons work it probably isn't a broken connector.

Rick

Yes, the joystick fire button works for all four ports. That's why
I'm so puzzled. I will check to see if the 6520 is seated
correctly. If the chip itself is bad, what other symptoms should I
be looking for?

1st - Star Raiders, Why I bought my 1st Atari Computer, a 600xl!

2nd - Star Trek by Sega is very Good. I love it when I Destroy Nomad! I'm missing the Manual, Box and the Joystick overlay!

I had Star Fleet 1 for my 800xl but I prefer it on my ST! I can completely control it on my ST's Numeric KeyPad! I wrote a review years ago! I'm good!

3rd - Silent Service is the 1st Commercial Disk Game I bought and my 1st Disk Drive was a Brand New In the Box 1050! Before Silent Service I played Submarine Commander on Cartridge by EMI Thorne Video from Kay Bee Toy & Hobby! My 3rd choice is Silent Service!

BTW, I love Simulators especially by MicroProse like Silent Service!

4th - I Love most LucasFilm Games like Eidolon, Koronis Rift, BallBlazer & Rescue on Fractulus! I love Games that use Fractal Math Like Silent Service & Rescue on Fractalus! My 4th Choice is Rescue on Fractalus!

5th - I Love many XE Game Cartridges, especially because Atari repackaged good games some formally on Disk! My 5th Choice is Star Raiders II!

6th - I know were only picking 5 but my 6th is Final Legacy by Atari! The Box says it's 3 Games in 1 and it's a simple way to Relax!

7th - One of my favourite Movies is War Games with Matthew Broderick and Ally Sheedy! I still have my VHS copy! I dont have it for the Atari by Coleco but I have EMI Thorne Video's release of Computer War. I love that the Tic Tac Toe is worked in!My 7th Game is Computer War!

I prefer Simple Games to help me relax! The more complicated work the more needed simplicity of play! Paraphrased from Captain Kirk on the Pleasure Planet on Shore Leave! I prefer an older familiar game over a new game to keep it simple, not learn a complicated new game with a big, thick manual! My 1st game is Star Raiders! I loved reading the Manual mainly because it spun a story which helped me get into the Fantasy of the story & prepared me so I could Play! "Do you want to play a game?" Quoted from War Games!

I'm so puzzled. I will check to see if the 6520 is seated
correctly. If the chip itself is bad, what other symptoms should I
be looking for?
****

Not much else to check on an Atari 400. You already did the voltage checks
and they were out of specs. You showed it wasn't the connector so it has to
be the chip. Time to replace the 6520 IMO. BTW: I hope when you shorted the
chip power pin to ground it was an accident.

Indeed! Thanks for sharing! Sorry I scaled them down to 400-wide instead of 640-wide. Force of habit from the huge collection of Linux User Group photos I've been posting for ages.

Thx again!

The list is endless really, but for a start:

Ultima 1-4
Star Raiders
Tempest Extreme
Alternate Reality series
PacMan
Castle Wolfenstein and sequel
Ball Blazer
Resue on Fractalus
Ms. Pacan

You can buy them both from Amazon.com.

Netflix Instant Watch is also available on a $100 box from Roku that
connects to your TV, as well as Tivo, XBox 360, etc. - so a PC or Mac
are not necessary. But I wouldn't go through all that trouble and
expense unless you wanted to watch more than just the one movie
(although WarGames: The Dead Code is also available that way). ;)

Actually, you control which movies go into your Instant Watch queue via
the Netflix website, so web access _is_ required.

Now, of course, Web access isn't impossible on an Atari 8-bit, if the
site is compatible with a text-based browser like Lynx (or the more
modern Links). 80 column terminal software with VT capabilities
(like IceT or FlickerTerm80 on the Atair) are likely required...
and, obviously, a box somewhere connected to the internet that you
can run Links on.

(I actually check my email on my DSL provider's shell -- where I also go
in and manage my website by hand-editing my PHP scripts and HTML :) -- and
can browse the web using Links there. I could almost certainly dial into
one of their dialup lines via my Atari 800XL, if I still had a modem.
I'm guessing that's more-or-less what Ben does to check his email and
Usenet, but I'm only guessing. If he's connected to a Linux or Unix shell,
then Lynx or Links is almost certainly available!)

And guess what!? I just fired up "links http://www.newflix.com/" on my laptop (which happens to run Linux), and have an ugly, but apparently navigable, view of my Netflix account!

And hey, there's my queue! :) I wonder if it works. (I know the Netflix site is heavily Ajax-based, meaning it uses DHTML tricks and JavaScript to talk to their server without actually going to a new page... e.g., for giving a DVD a particular rating, or re-arranging your queue.)

... Hey cool! I just moved: "Mystery Science Theatre 3000: Teenagers from Outer Space" from the 2nd to first queue position using the "^" button. Netflix might actually be relatively usable via a text-only browser! :)

Heh, I've got some other Bob Woolley & his Magical 1200XLs shots from
one of the times I went to Vintage Computer Festival.

http://www.newbreedsoftware.com/bill/photos/vcf60/img_2064.jpg
(hey! Same Pac-Man shirt :) ... and that's our friend Ben Corr on the right,
making a funny face ;))

And the rest (a punch of Bob's hand pointing at the insides of his
1200XLs) are here, of course:

http://www.newbreedsoftware.com/bill/photos/vcf60/

Enjoy! :)

(Oh, I also went to some other VCF shows... replace "vcf60" with "vcf70"
and "vcf80". It doens't look like Bob made either of those.)

You won't find any MyDOS versions that do what you want with full
disks to duplicate. One or two pass duplications can only happen with
basically empty disks with standard MyDOS and there are no "super"
versions that magically used extended memory without regard to
possible ramdisk data. You will have to write it yourself or use a
third part app that does exactly that - I don't know of any. Except
perhaps copymate, didn't they have an extended memory version?

Exactly, you cannot do a single pass "J" Duplicate disk" for boot disks
and those with system files or hidden data; you can only do a "*.*"
wild card file copy into and then back out of the RamDisk in one pass
each way. And, yes, Copymate did have a version or maybe just a
configuration for the 130XE that utilized all of the RAM for single pass
copies of SSSD 720 sector floppies.

I have used an extended memory sector copier (which also uses high speed routines e.g. when used with my Speedy enhanced drive and SIO2SD) lately, and this one was written in 1988: the "SECTORCOPY 1.5" off the Speedy System Disk (you will find a Polish language stand-alone version at atarionline.pl)

IBTD here. For use with disk drives I prefer Stefan Dorndorfs XDOS (a
late heir of the great OS/A+ by OSS), and I only use MyDOS/MyPicoDOS for
larger disk images on my SIO2SD.

I have yet to use SpartaDOS, though, but have been told it is very good.

Oh yeah, duh. He'd need broadband (or a neighbor willing to share some
wireless broadband), which I somehow doubt he has, if he hasn't got a
modern PC or Mac connecting to the Internet.

Why do you people still use ATARI 800 computers???

The C64 is far superior, it has 8 real sprites, better scrolling
and a real sound-synthesizer chip, the SID.

Why did anybody buy the inferior ATARI 800???

The ATARI 800 is crap, when it's compared to the C64.

Why don't you throw away your ATARI???

Maybe because I want to play a proper version of M.U.L.E., Rescue on
Fractalus, Ballblazer and a bunch of others ... Dropzone was not better on
the C64 ... The explosions in the Atari version is beautiful. I have C64
too, but Atari's have soul ...

I'd take anything so long as it's up to the task. And depending on what
I'm doing, that could be just about any 8-bitter.

For some things the better machine is the Atari 800, for some things the
C64, and for some things the Apple][.

(Though, imho, the VIC-20 might have been a good game system for its day,
and certainly it stomped the Atari 2600 flat, but as a computer, it was a
joke.)

Hey!

The VIC-20 was a MAJOR step up from my first computer ... a home-built 8008 machine with 128 BYTES of RAM that used a paper TTY and punchtape for I/O.

I learned to code writing programs that did multiplication and long division while showing all of the work on screen. ;) Made homework easy.

(It was also the only machine I've ever destroyed through software alone -- was trying to write out Morse Code practice tapes and figured I'd just toggle the data-write line of the cassette port. No smoke, but it quit working.)

Also learned 6502 assembly on that machine.

That said, the Atari 800XL quickly became my second love and getting used to "Atari Strings" set me up quite nicely for doing weird things in C.

When I hit high school the Atari became my 'graphing calculator' for calculus.

Hey ... it was 3rd and 4th grade homework ... didn't take a lot of space.

Hardest part was keeping track of the decimal point. Ended up using
inverse video to mark the decimal part.

If you get a any screen => boot went as far as initializing hardware that
far. While it could be something else, usually it means that ROM, 6502,
GTIA, and POKEY are OK. Swap RAM chips if you can as a first try. There are
other things that can go wrong like if you have a Rockwell 6502 made in
Mexico they fail when they heat up or sooner if you are unlucky.

The ATARI had the better graphics. Well AFAIK 256 colors instead of the 16 of a C64. You cannot do <http://www.youtube.com/watch?v=e-ZbgXolZQs> with a C64... Well after seeing this video, I thought it looked way better when I saw it on an ATARI back then. Looks like the C64 could do that too now

> Why did anybody buy the inferior ATARI 800???

I guess it's that you buy what your best friend already has. If he has his new ATARI and shows you what it can do, and none of the other guys you know have a C64, you won't buy a C64 then.

> The ATARI 800 is crap, when it's compared to the C64.

I brought an 800 up out of the basement a few days ago, and have been playing games on it with my kids. It's kind of like Christmas for them, as I haven't had a system set up and going since my oldest was a toddler (she's now 12).

I'm unable to find all my disks, and can't find the sio2pc interface that I built 10 or so years ago, so I'm doing what I can with the disks I can find while I wait for the sio2sd interface that I ordered yesterday to arrive.

Anyway, I'm wondering what games were made that will allow up to 4 players? These are the ones I'm aware of:

M.U.L.E.
Party Quiz
Dandy

Any others?

Thanks,
Trevor

There were two games that a couple of friends had that I liked on the
C64 that weren't available on the Atari, but that was the only thing the
C64 ever had going for it... ;)

Subject: 8.3) What games support 4 or more simultaneous players?

Contributors to this section: Jeff M Lodoen, Vidar \"Hawk\" Olavesen, Pat
Mulvey, Steven E. Posey (Party Quiz), Andreas Koch, Florian Dingler,
Matthias, Jason Harmon, Cathryn Mataga, Andreas Koch again 2008.06.10

a) The following games support 3 simultaneous players:
(2 players via joystick, 1 player via keyboard)

- Dynakillers full-version by GMG/Slovakia (Freeware!)
- Blastermind by Numbercruncher/Germany (Freeware!)
- M.U.L.E. cracked+changed by CSS/Germany (pirate copy!)
- Achtung Panza ! (from 6502 compo)
- some more PD and commercial games...

Arek Jezowski writes (16 Apr 2007):
- M.U.L.E. supports three players on two port joystick machines (800xl,
65xe etc).
the game goes like this:
- joystick in first port
- two paddles in second port
then:
- button confirming, land grant phase, auctions - each player is
using of its controller
- phase that require movement (pub, mule deployment etc.) joystick is
passed between players on its turns

b) The following games support 4-joystick head-to-head play:
(Only the 400 and 800 computer models have 4 controller ports)

- Ali Baba and the Forty Thieves by Quality Software
- Aliens a PD-game by ??? using an altered Dandy program
(the Dandy font and thus the graphics were changed, however,
the levels remain the same and can be used in both games);
- Asteroids cart. by Atari,

- Basketball cart. by Atari,
- Battle Room (CIA vs. KGB) a PD game by SNACC
- Dandy disk by APX,
- Depth Warrior by ??? from ROM magazine, Aug. 1984 ***
- Floyd of the Jungle
- Major League Soccer cart. by Thorn EMI,
- Major League Hockey cart. by Thorn EMI,
- Soccer by Gamma Software
- Hockey by Gamma Software
- Maze War disk or cart. by ???,
- M.U.L.E. disk by Electronic Arts,
- Roadblock by Brian Holness from Compute! magazine
- Silicon Warrior disk or tape by Epyx,
- Sky Warrior by ??? from ROM magazine, June 1984 ***
- Survivor disk or cart. by Synapse,
- Tank Battle by Fred Pinho from Antic magazine:
http://www.atarimagazines.com/v3n2/animate.html
- Volleyball by ??? (PD game written in Atari BASIC);
- Yellow-Brick-Road by ??? from ROM magazine, Feb. 1984 ***

*** these programs are reported to be 4-player programs, I'm
not sure if they are meant to be 4-players simultaneously
or 4-players - one after another (try to find out!);

c) The following games support 8 players on the 400/800 or 4 on the other
computer models, using the 2 controllers-per-port CX30 Paddle controllers:

- Super Breakout by Atari,
- Worms? by Electronic Arts
(a "life" like sim., has nothing to do with the PC game!)

d) The following game supports 4 players on all machines, using special
4-button keypad controllers linked together with RJ-11 jacks (standard
phone jacks) to a box with 2 joystick port connectors:

- PQ: The Party Quiz Game by Suncom

e) The following programs support multi-joystick games, using extra
hardware called Quadrotron (from the German Atari Magazin 2/1989):

- test program for 4 joysticks (and assembler source);
- Quadro-Tron by H.Schoenfeld (4-player Tron-clone);

f) The following programs support multi-joystick games, using extra
hardware called Multijoy (multijoy4 for up to 4 players, multijoy8
for up to 8 players and multijoy16 for up to 16 players; originally
developed by Raster/Radek Sterba, but also available from ABBUC):

- Astro4Road by Fandal
- Bremspunkt (demo-version) by T. Butschke
- Bremspunkt (full-version) by T. Butschke
- Card Grabber by F. Dingler
- Cervi by R.Sterba

- Cervi 2 by R. Sterba
- Fujirun by Schmutzpuppe (see below!)
- Hardwaretester/Peripheral Test 2.0 by Florian Dingler, 2008
- Icehockey by F. Dingler
- Multijoy-tester by Fandal or Raster
- Multris by R.Sterba
- Quadrotron-M4 by R. Sterba
- Sheep-Race by F.Dingler
- Shot'em All by R.Sterba

The following patches are available at:
http://mitglied.lycos.de/gunnarbusse/bajamar/download.htm
- Asteroids, modified for Multijoy by Schmutzpuppe
- Basketball, modified for Multijoy by Schmutzpuppe
- Tennis, modified for Multijoy by Schmutzpuppe
- Dandy, modified for Multijoy by Schmutzpuppe
- M.U.L.E., modified for Multijoy by Schmutzpuppe

And the following patches are available at:
www.atari.fandal.cz
- Wingman modified for Multijoy by Fandal
- (Thorn EMI) Hockey modified for Multijoy by Fandal
- (Thorn EMI) Soccer modified for Multijoy by Fandal
- (Gamma) Hockey modified for Multijoy by Fandal
- (Gamma) Soccer modified for Multijoy by Fandal
- Battle Room modified for Multijoy by Fandal
- Silicon Warrior by Epyx modified for Multijoy by Fandal
- Mazewar modified for Multijoy by Fandal
- Survivor modified for Multijoy by Fandal
- Floyd of the Jungle modified for Multijoy by Fandal

The Kenbak wasn't an 80xx machine; it had a custom TTL CPU. Most
likely he's talking about one of the various S100 systems back in the
mid-late 70s.

Know of any place I can get a set of RAM cheaply?
****

If you are in a hurry, old MSDOS XT type mother boards, memory boards, or
video cards can work.. IIRC you can even plug in 256k X 1 chips and they
will function as if they are 64k X 1.

If you don't have a surplus store or recycling store near you, I probably
have some 64k X 1 left over from upgrading XL computers to 256k.

Usually one working chip is enough. You just substitute it one position at a
time until the computer boots.

Rick

Correct, it was an S100 based machine. Don't remember what it was, but
it was a single-board machine with simple I/O ports on board. Built-in
ML monitor that allowed hex to be keyed in through the keyboard and you
could 'save' by doing a hex dump with the tape puncher on. Patch the
binaries by splicing tape ....

I only used toggle switches to program once ... that was on a single-step
PROM burner. Glad I missed that particular era of computing.

On the 65XE all the ram chips are soldered.

My guess would be that this won't go well together. The problem is that TurboBasic requires a bit of low-memory, right above the end of the FMS, and that looks pretty much like the same area S.A.M. wants to go into.

So long,
Thomas

I had to use toggle switches to program the boot sequence on a Pr1me mini
and Data General Nova, I believe. I think the Eclipse model didn't require
that.

We had paper tape readers on the PDP-11/70 and maybe the 11/44's. Never
needed to use them, fortunately.

That's a shame. I've got 256KB on my 800XL... any chance either of them
could be convinced to bank back and forth? >:^)

Or maybe I need to just crack out Action! + SAM. Ugh, not that I have time ;)

Atari XF351 disk drive is never released. I wonder if the 8bit computer can communicate with the SF drive? because both 8bit and SF have the serial port. So is it possible? Need the communication adapter? like Atarimax's serial interface for APE.

Thanks!
Jack

The XE series are not easy to remove the RAM chips. Most likely this is
your problem. Especially if they are 'MT' type RAM chips.

I can remove the chips, install sockets, and install the new RAM if you need
some help. There are people on here who can vouch for my work.

Thomas

Yes they are soldered, had fun removing them. Planning on using
sockets. I think there were 2-3 of the chips that ran very hot after
about a minute so I removed them all. None of the other chips ran warm
at all, so either they are good or dead (hoping for good).

After I posted I remembered I have a Commodore 128k RAM cart I was
going to mod for 512K and the chips inside happen to be 16 64K so I am
going to use those.

Hopefully I get around to finishing it this weekend and it works.

If it works what was the model number for the XE version of the floppy
drive, or did everyone use the older XL style drives with it?

Any 8-bit Atari drive will work. The "XE version" is the XF551, which is
double sided double density (360k), and some people used custom ROMs to
convert it for a 3.5-inch mechanism with 720k capacity.

Had to order some sockets for the ram, funny how cheap stuff is from
HongKong and Thailand (shipped even). Will know if this works in a
couple of weeks when they get here.

Which of the Atari floppy drivers were the most reliable? Most of my
experience has been with C64 machines and drives having never owned an
Atari 8bit (did have a friend who had one back in highschool). I have
one of the Ultimas (2?) that had C64 files on one side and Atari on
the other that I want to play.

Thanks for all the help.

The XF551 was known to have weak connections between the circuit board
and the SIO sockets. It was recommended to keep the cables plugged in
and unplug the other end. Other than that I think most drives were
pretty reliable, but I only had a 1050 and an XF551.

Potentially granting that, how was the sound chip compared to the SID?

The Apple had nothing but a speaker toggle, though the AY-8910
daughtercards are nice.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Infogrames Entertainment SA.

What's the length limitation on extending the cartridge port?

There was - I've not checked it in a long time and when I did just now,
I got a page not found error, with an additional note that the Atari-users
map module was unavailable.

You can see it here:

http://www.atari-users.net/index.php?module=Atari-Users%20Map

I've got one in my basement with about 7 undeveloped pictures on it... I
wonder if Kodak can still develop them?

Unequivocally, no. I used to work for Kodak's film processing
subsidiaary, Qualex. Film production for Disk format ceased in the 2nd
half of the 90's, just before I left in '98, Disk and 126 cartridges
were changed to 3-day service and all sent to one plant, and around 2k1
to 2k2, all services for disk ceased. And even if you could get it
processed, the color layers of unprocessed film rot unevenly, so the
colors would be terrible after this many years, if any image even
survived.

OK, it turns out, not so no. There are a hand full of places that do
Disk, but I would expect the price to be high. Try Blue Moon Camera,
Film Rescue or Rapid Photo. Don't have any URLs, but Google can be your
friend on these. Again, though, with the age of the film, there is
likely to be severe color drift. Combine that with the fact that the
printable surface area of the film so small, the picture will
resultantly be very grainy (which is why popularity died, when far
better 35MM technology created more Instamatic-like 35MM cameras).
You'll have to decide if those 7 pics are worth the effort and expense.

FWIW: Just took some old 126 film to Wolf Camera and they sent it out to a special shop. Took like two weeks to get prints back me thinks. Color was kind of bad as you mention but then 126 film was never exactly intended for professional use to begin with. The pictures were ~25 years old in a camera one of my recently deceased friends owned. I was packing up stuff to send to his family who are out of state when I came across the camera. There were pictures of both my friend and his parents that I was able to send to his family. Really worth it under the circumstances and thanks for making film that would stand up to this type of storage and abuse while you were at Eastman.

Not to hijack the thread, but now that I have Basic XE and Basic XL I was wondering what would be the best Basic programming environment. I used Turbobasic a lot, but cut my teeth on Atari Basic.

On another topic, My summer project is to finally learn assembly. I have Atari Assembler and Mac/65, what are there any other assemblers I should look at?

(BTW, I would like to run them all from my MyIDE cartridge... :-)

I don't get the speedup you get with a US dblr
and APE. You set the speed within APE software.
The US Dblr is in a real 1050, and as far as I know,
there isn't a high speed facility to MyDOS with
the dblr. A US dblr will sense SpartaDOS and
do high speed automatically. Also, you format
a floppy in a dblr 1050 in ultraspeed sector skew.
I don't know if MyDOS will work with a dblr
sector skew disk.
Personally, I don't like speedup disk access.
I'm more concerned with error free usage.

TurboBasic is rather convincing, and rather popular in Europe - you get it
for free. Basic XE/XL were proprietary, I never used them a lot - but that
shouldn't mean they're bad.

> On another topic, My summer project is to finally learn assembly. I
> have Atari Assembler and Mac/65, what are there any other assemblers I
> should look at?

I think the Mac/65 is probably the best assembler you can get for the 8-bit.
The Assembler/Editor is rather rusty, there is EASMD, also by OSS, but that's
just the precursor of Mac/65 and not quite as powerful, and there is also
the Syn-Assembler by Synapse. Of all those, I liked the Mac/65 the best. Very powerful,
very fast, and the cart version has a very good debugger built in that is much
more useful than the simple monitor in the Assembler/Editor or Bug/65.

So long,
Thomas

Source record: 2204

<drumroll please>

And we have a winner!

Reefer is the winner of our April 2009 prize giveaway.

Congratulations!

We use a small ST application called winner that randomly
picks a name from a list (text file). A script on DarkForce
records callers to this list during that month. So the more
a person calls, the greater their chances of winning. Its not
guaranteed though - but in this particular case, the program
did pick that one. Reefer called 32 times. :)

I'd like to thank everyone who did call - we saw a massive surge
this last month, over 225 calls!

Don't forget to check back in occasionally - we give away prizes
all year long. :)

The bigger question is why are you here? I bought a C64. Owned it for a few months and then gave it away. True, it does play games really well (the XE system is just as good), but it is not a good computer. Ask any computer expert to look at the two and they will tell you that the C64 is just a hack and that the good is a true computer. Plus trying to enter things into the C64 is just so clumbersome. I will stick with my Atari.

So, "the good is a true computer"? Where can I find a "good"?

The same place you find a computer expert... in comp.sys.cbm. I am a computer expert and I do not believe the PET, VIC20, C64, C128 or AMIGA and other cbm machines are hacks any more than I believe that Jack Tramiel is a hacker except in the nicest way. I am also an authority on Apple II's and IBM-PC's and have been making my living by being a computer expert since shortly after the C64 was introduced.

I think what the OP meant was "Ask a hack to look at the two and they will just tell you anything. Any true computer expert will tell you the C64 is good."

"Edward S. Baiz Jr." <edbaizjr@comcast.net> wrote:

>Plus trying to enter things into the C64 is just so clumbersome.

How could you possibly remember? You gave yours away long ago.

What kind of things I wonder... if you are talking about entering BASIC programs into a C64, my daughter was keying-in her own into her C64 when she was 6 years old unassisted by anyone, and she also used a real 4.77 MHZ IBM-PC and MS-DOS with the same proficiency and joy. She is a psychologist now specializing in personalities and statistics as well as a computer expert.

The last time we talked about the old computers and the new computers which was recently it was all good for both of us although she is not preoccupied with collecting old commodores and apples as I am.

Glad you like your Atari.

Bill

(Top post here.)
All hail Jack Tramiel
All hail Nolan Bushnell
All hail (enter C64 engineer here)
All hail Jay Miner (Atari engineer)
I don't know what the hail.
Both are fantastic machines.
I just don't have any more room for
junk, so I don't collect more than
one.
I still am amazed by the machine
and learn new things 26 years after
my first purchase.
The Coleco Adam was my first purchase.
After three smokers on first startup
I returned the Adams and took my
son's advice and bought the Atari.
I haven't been sorry since.
My understanding of the Atari helps
me be facile with a PC.
Hardware people keep coming up with
new items that help keep them alive.
Atari can have a cart that allows
use of a SD card! I'm sure there's
comparable new hardware for the C=64.
Apples were, and still are, for more
uppity people. Oh, all hail Steve
Jobs and Wozniac.
(Darn, I promised myself not to
feed the troll.)

So are all the computers of that era. With irrealistic deadlines,
without factory standards (for the low-price segment of the market)
and without the possibility to fix early software/hardware problems
with just a firmware update over the Internet, it seems incredible to
me that these computers work(ed) at all. This only proves the
competence of the engineers that developed them.

True. But it was a different time. Internet was not available for the masses and so these computers not designed for a firmware update. Though it was possible to burn a different firmware on an eprom.

As I have to soldering skills a friend did this for me in about 1987 for my C64, and I had the original, and a customized firmware, including turbo loader for floppy and tape on a second PROM and a switch (drilled a hole into the chassis) so I could "boot" one of them at a time.

The Amiga (1000) then came with the firmware on floppy (Kickstart) so bugs were fixed and functions added. Still no internet for regular people available. But you could get the floppies from a store (or friends, along with other cracked programs :-).

BBS were around already, and few people also had modems or those acoustic couplers and I'm sure you could also download firmware there.

F'up2 comp.sys.cbm.

I miss those good old days. (Well, not really, my 800XL is hooked up
to my big TV in the living room, and when modern PCs start to piss me off
too much, I fire up a nice game of Pac-Man or Dig-Dug :))

> --
> Ryan 'Gozar' Collins

There is no high-speed SIO driver within MyDos. However there are several high-speed SIO patches and other operating systems that have SIO built-in drivers. APE Warp, High-Speed Patch (driver from Sparta), etc.

A very fast and quite compatible patch is from Hiasoft:
http://www.horus.com/~hias/atari/

You might find the background info interesting at AtariAge:
http://www.atariage.com/forums/index.php?showtopic=139077&hl=

I've been able to get SIO of 127Kbs using APE USB with MyDos and Hias' alternate high-speed patch, although as a practical matter, the actual transfer throughput is essentially no better than at 74 Kbs. Of course, you can't get that fast on a real Atari floppy drive, but on APE or the new SIO solid state devices (SIO2SD, S-Drive, etc.) you can.

Don't waste your time looking for a "good". Look for a "best" instead. The
best is much better than the good.

What else can I add to the confusion created by someone replying to a 2 week
old troll?

Although better is better than good, best is better than better. By all
means, best is the very best!

Except, the only one that might be better than the "best" is the "excellent"
for what can be better than excellent?

If anyone is not confused yet, I will replace the batteries in my thesaurus
and return shortly to take the confusion level to the highest level
attainable by mere mortals.

You can get almost any Atari software for free, but legally, Turbo-Basic XL is not freeware and only may be legally used by (former) owners of one of the three Happy-Computer magazine issues (one regular, 2 special Atari issues) where it was printed <http://www.kultboy.com/magazin/820/>, <http://www.tmeyer.de/atari/hc-xl-1.jpg>, and the compiler may only be legally used by those who owned the second special Atari issue of "Happy-Computer" <http://www.kultboy.com/magazin/2754/> which also contained the third reprint of the interpreter or bought the original magazine disks (like I did). Yet the publisher never persecuted copyright infringements and of course it is hard to tell nowadays who typed in the files back in 1985/1986 and who only owns a copy.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Infogrames Entertainment SA.

The chip sockets came in today and I soldered it up. The unit turns on
to a small square prompt for a few seconds and then a ready message
comes up, keyboard works. On the 65xe was there supposed to be a logo
for atari on the screen at startup or a free memory text like in a
C64? Also is the ROM slot known to be picky (some carts needed
reseated a couple times to come up)?

The pause before READY comes up is it trying to find a floppy drive to
boot from. (It makes a clicking noise.)

> On the 65xe was there supposed to be a logo
> for atari on the screen at startup or a free memory text like in a
> C64?

Nah, just READY. On the 1200XL, if you booted without any cartridge or
disk (it didn't have built-in BASIC like the other XLs and the XEs),
you'd get a big rainbow "ATARI". Press HELP to get to the system test
screen.

On the other XLs and XEs, disable BASIC by holding OPTION while you turn
the system on (or type "BYE" and hit RETURN in BASIC), and you'll go
directly to the system test screen.

Good luck,

My domain name (atariplanet.info) apparently expired without me
realizing it, and it turns out that just today someone else snatched it
up. :(

So, my Atari web site is now only accessible at either of these addresses:
http://www.holyoak.com/atari
http://atari.holyoak.com

And the BBS list would be available at:
http://www.holyoak.com/atari/ATARIBBS.TXT
or http://atari.holyoak.com/ATARIBBS.TXT

Unfortunately, I'm afraid it's linked to the old address from a lot of
different places. What a mess. :(

Thanks,
Trevor

Perhaps in some alternate time-line, the world runs CP/M GEM 2009 on the latest Commodore B series derivatives purchased at Service Merchandise and Gold Triangle. Anyone willing to jump into a black hole and find out for sure?

Not at work which means not in the home. To much infrastructure to change. If the VP in charge of IT is familiar with Windows and Windows applications<which at this stage is just about a sure thing> you can bet they won't go for anything different.

The 32 and 64 bit CPUs well be here in devices. I have a Chinese [camera, DVR, NES emulator, MP3, MP4, FM radio, USB drive] that runs on something like a 200 MHz ARM 32 bit processor. You probably have a couple of similar power processors in your cell phone or GPS.

> into.

TurboBasic XL can be easily persuaded to move it low-memory pointer higher.
It requires running a short program first, which then will run the program
that will
execute after the memory pointer is changed.

I used this technique to place device handlers in lo-memory. It also
worked well
for a customized version of Dos 2.5 that allowed me to use 1mb of extra ram
as a
RamDisk and other storage space.

All that would be required is the address range that would be needed to
"house"
S.A.M. .

2ï¿½ If you still have a PC with serial ports, go for a SIO2PC cable. Takes about an hour to put one together and you will only need a real drive for copy protected programs if you can't find cracked ones.

You only need some flavor of 1489, one diode, and plugs to go in the Atari and PC. You can find 1489s cheap or salvage one from just about anything PC that has serial on it. Some people even build them into their Atari and just bring out a 9 pin serial cable to the PC.

Rick

Okay, lets see, what was in like in the Alternate Earth 3166823094-34

Ah, I see.

It appears Atari wasn't stupid enough to let the Amiga Stuff go, so
it's Atari Amiga Line of Gaming Computers.
IBM blundered. Apparently they figured it was best to Copyright and
use some sort of primitive encryption on their PC Bios. Their first
OS, PCDos was an internal project. They were going to hire the Basic
Language maker, Microsoft, but when they found out their were buying
the rights to Quick and Dirty OS, they decided to cut the middleman
out. IBM and Apple joined forces to crush the Business Computer Market
with their Gala Business Machines (GBM).
Meanwhile, Commodore, seeing as the're gaming machines ended up
failures (internal problems, never could get their act together,
thought they'd live off of C64 profits forever, oh wait, that could be
our time line), and no one in america really considers them to have
"business machines", they decided to join forces with Intel, and SGI
to bring a new generation of computing to the massess.

Sun was unable to compete on the hardware market against IBM/Apple, so
they quietly faded out of the picture.

AMD and Nvidia joined forces to make chipsets and GPU's for various
machines. Motoralla got bought up by AMD/Nvidia, and they started
producing the PowerPC cpu.

Okay, we are running basicly unix on our Commodore currently. SGI
and Intel conviced Commodore that running the OS Open Source would be
the best way to get market share. Sell the hardware and the
services, not the software.

GBM is running GBMdows (nicked named GBM Blows) a closed source OS.

well, I would have more for ya, but I have an eq2 raid in just a bit,
and I meant to run to the store before. But this was fun. lol

I have a XE1541 cable for my C64 to make real floppies from images I figured I would do the same for the Atari. Hopefully original software will be about as easy to find as C64 software (and I do have a TOSEC archive of the Atari).

You can pretty much find any disk image you want online but I prefer to play original games on real hardware.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Infogrames Entertainment SA.

I've been curious for a while about whether the prices you publish
already have the 20% taken off?

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Infogrames Entertainment SA.

3161. Anyone know where I can find a copy of BASM? (basic/asm hybrid)

Newsgroup: comp.sys.atari.8bit
Date: 2009-05-31 05:23:40 UTC
From: Kristopher Neidecker <biffsnotnodules@yahoo.com>
Message-ID: <50aec792-efcd-405b-a29c-c5b600283551@t11g2000vbc.googlegroups.com>
Source record: 2250

I am looking for a copy of BASM preferably a disk image I could use in
an emulator. Any ideas?

Are you talking about an assembler by Peter
Englebrite of Epyx?
If so, I can't find it anywhere.

3163. Chameleon

It was a terminal emulation program by John Palevich (sp?) originally distributed through Atari's APX program.

I used Chameleon (tape version) many times to submit programming assignments to school (way back when). Using tape and the slow transfer rate (300 baud) was incredibly cumbersome but it beat driving to school at 2:00 AM (the only time the campus terminals seemed to be available).

- Steve Sheppard

And, wasn't 300baud just marvy ??

There was also a loadable desk accessory called Chameleon. It allowed
you to load and unload ACC's at will.

Mark

2009.03.31 Zdenek Burian: FLOP 52
2009.03.05 added Avery Lee (Altirra 1.0)
2009.03.02 deleted: MacFalkner (web site gone, thanks Laurent)

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry should contain a valid postal address or web page address.

Unless explicitly requested by the vendor, no entries will include an email address due to the overwhelming amount of spam that would result.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

I was in the same boat, used it most of my freshman year with my little
xm301 modem and 800xl. I at least had a disk drive though. :-)

I have Chameleon for the Atari 8 Bit if you want to buy it? Thanx! =-=Ben=-=

---------- Forwarded message ----------
Date: Sun, 31 May 2009 22:04:08 -0400

Anyone remember Chameleon?

IF so, what was it for?

Ohh my Twitter, Well at the moment....

I appreciate the info, was there a picture of a chameleon on the disk label
or on the
cassette version if anyone remembers?

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

Attention all retrocomputing enthusiasts!

RetroChallenge 2009 is officially slated to run from July 1st to 31st,
2009.

RetroChallenge is a fairly informal "contest" whose sole aim is to
encourage owners of obsolete systems to do something (anything) with
them.
Projects are self-assigned and can include just about anything, from
programming to hardware hacks; restorations; multimedia... whatever
floats
your boat.

RetroChallenge is open to rosy-cheeked noobs and hoary old wizards
alike.

Swing by http://retrochallenge.net for all the details, or visit the
RetroBBS at telnet://bbs.retrochallenge.net

ok, I think there are 2 programs with the same name. Or same program with
different
labels. Just trying to clear something up. Thanks.

I'm looking at the Disk Label right now, there is no chameleon on the label!
It's an APX Title with an APX Manual with Rainbow Colors on the cover! It's
about a 26 page Manual!

ok, I found what I was looking for, there is more than 1 program with that
name.

btw Ben, do you have any new 5 1/4 floppy disks for use on a atari 1050
drive?

.

3193. Bedtime reading

Newsgroup: comp.sys.atari.8bit
Date: 2009-06-19 20:36:02 UTC
From: bill@newbreedsoftware.com
Message-ID: <4a3bf6b2$0$1592$742ec2ed@news.sonic.net>
Source record: 2032

So I decided to crack open the Action! reference manual. Read through the first 50 pages of it before I fell asleep.

One of these days, I swear, I'm going to fire Action! up again and write some more games. I feel like I've learned a lot more as a programmer (esp. when it comes to debugging), so I'll probably be a LOT more comfortable with it than I was 10-11 years ago, when I wrote GemDrop. ;)

I'd love to whip together a silly little educational game for my toddler. (My idea involves controlling a garbage truck. Difficulty could scale up, starting with basic "drive the truck and collect cans" all the way to where you have to start matching colors and/or shapes/numbers/letters.)

What I really need is:

(1) A proper place to set up an Atari 8-bit. (Right now, my 800XL lives in the bottom drawer of the TV stand, meaning it's not exactly ergonomic sitting, and typing is almost out of the question. :) Find for playing most games, though.)

(2) Free time. ;)

Speaking of Action!, it'd be really cool to be able to code in Action!
on a modern system (like my Linux laptop). Compile and link the binary,
and fire it off in an emulator, like Atari800.

Maybe, I guess, I should just start looking into CC65... Hrm

you can download a tool that mims the Action language

http://gury.atari8.info/effectus/

I am about to get an Action! cartridge and wonder if you know where I
can get a scan of the Action! manual

thanks

Hrm. Windows only? :((I can't tell, only guessing from the screenshots.
Plus, I don't really hear much about Pascal use on Linux these days ;))

> I am about to get an Action! cartridge and wonder if you know where I
> can get a scan of the Action! manual

I'd expect to see it here, if it were available:

http://atariarchives.org/

Wikipedia says:

"In January 1988, ICD and OSS merged. Later, Fine Tooned Engineering
owned all of ICD 8-bit products."

and, assuming that's accurate, that means FTe owns the rights to Action!
and the manuals.

Oh, and in the meantime, I totally forgot about this!

http://joyfulcoder.net/atari/action/?tab=language

Enjoy! :)

TEHRAN: Iran's opposition was set to hold marches and a day of
mourning Thursday for slain protesters as they keep up pressure on the
authorities over the disputed presidential election in the country's
biggest crisis since the 1979 revolution. Thursday's first rally was
set for 2 pm (0930 GMT) in front of the offices of the United Nations
and the second at 4 pm at Imam Square, according to people who took
part in marches on Wednesday. Meanwhile, ... Full Story

The manual sucks. I had to take a night class in C programming and use a
disassembler on the code produced by the cartridge before I even 'got'
what Action! was about. While it isn't a requirement I would say that
assembly language programming helps and prior experience with structured
languages like C or Pascal puts you a mile ahead on the learning curve.

The manual does have some things like how to use the editor that are helpful but errors, less then helpful examples, and omission of the basic ethos of structured programming and parameter passing makes it a tough read.

Rick

Last-modified: June 6, 2009

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

I may have a spare manual and/or could scan a copy and make it available.
Just got my wife a fancy multifunction unit that scans stuff fast and good,
so I might as well put it to good use. I'm guessing an OCRed version would
be better than straight image PDF...

What's funny is: Pascal (on Apple II in high school) and Action! (shortly
thereafter) helped me comprehend C when I took it in college. :)

Of course, now, looking back at the Action! manual, the first half of it
seems pretty nice and thorough... then towards the end (sadly, as they
got into more complex topics), they kind of brushed past everything. :)

So as I read it, I say to myself: "oh, NOW I get it" (after years and years
of C and PHP experience).

You are a professional in all things computer now right?

How hard is the simultaneous handling of multiple connection in things
like web pages handled? Is it possible to have ~200 users at once? Would
can it be done as a bot?

Set the WAY BACK MACHINE to the year 1985 A.D.

Compucat BBS had a text on online adventure that they converted to a
graphical adventure similar to Rainbird's Knight Orc. The usual EWNS
with pictures loading at various spots. They did the graphical version
for the ST and I wrote a terminal program for the 8 bit that was
~equivalent for a R: input BASIC. I just used an escape sequence that
you wouldn't normally see in text like #G to turn control over to the
modem language interpreter.

So now we have something like 8 million knuckleheads playing WoW every
night and MMPOG have been out for 12 years.

So what we need is a bot or web page
that will echo what one user does to 200 others if the situation calls
for it. That is it has to be smart enough to know that if your character
is on level 9, mine on level 8 will not see what he does. Maybe a multi
player Rogue style game.

I figure we should do it before the C64 crowd!

Rick

In the past I put together a very basic multi-user web-based chat system
using a CGI. It involved plaintext files for the user database and
the current chat, and lockfiles which _attempted_ to keep it from all
getting clobbered at once.

These days, I'd do it using shared memory on the webserver, or if it's
pretty low-speed, a basic database (like MySQL) should be sufficient.
(It handles all the caching, shared memory, etc. behind the scenes, anyway.)
That reminds me...[*]

> I figure we should do it before the C64 crowd!

Indeed! They get all the cool toys, these days! :^P
(Well, my SIO2SD is pretty frickin' cool.)

I had to write a multiplayer online maze game for a network programming
class I took in college. We simply started a new thread for each
connection. That's what server programs typically do, and you're only
limited by bandwidth, memory, and processor capacity. (Only? :))

Well the scoop is I have 10 megs of web space on earthlink and I am in favor of going the path of least resistance. I got in trouble for running bots on my old netmagic account but it wasn't my fault. I'm not sure about earthlink's policy.

So does MySQL called off a web page or does it need its own environment? It's the e commerce thing right? I want to keep it small and simple so an app that needs 500 megs of space is a no go. I'd settle for a script!

I'd really like to keep it as simple as something that lets people join, just echos moves from one player to the others in the game. Figure do everything client side for the first go around.

Something like:
Rick starts game, level is generated on Rick's 8 bit.
Trevor joins game
Rick gets notice of Trevor wanting to join
Rick's level layout gets sent to Trevor
Rick's sends notice of Rick to Trevor
Bill joins game
Rick gets notice of Bill wanting to join
Rick's level layout gets sent to Bill
Rick's sends notice of Rick to Bill
Rick sends notice of Trevor to Bill
From there program would just echo
Bill moves north one step
Rick gets told Bill moved
Trevor gets told Bill moved
BUT with everything tokenized on the client side.
i.e. Character Bill is 1 and move direction is encoded in a single byte
i.e. ~first 2 bits is direction and next six is number of tiles. So data stream would look like $01$41 that would mean Bill moved one tile north.

I mean I see web pages with info like "There are 3 registered users online and 2 vistors" or "Look up posts by ricortes" et cetera. Just want to do something simliar for the first go around.

If there is any interest we could do data storage and result calculation server side but I really don't anticipate interest getting that high. Couple of jokers showing it works then we all walk away.

Rick

I've got a webserver (virtual private server, these days) that hosts
tuxpaint.org and billsgames.com. Full root access, MySQL installed,
practically limitless space and bandwidth. (Esp. for Atari 8-bit needs :))

Seems more flexible to have the level generated on the server.

<snip>

So in other words, we could do "web-based" multiplayer game, for
typical PC users with browsers capable of rendering HTML and GIF/JPG/PNG
images, and then a binary-encoded version for Atari users.

> If there is any interest we could do data storage and result calculation
> server side but I really don't anticipate interest getting that high.
> Couple of jokers showing it works then we all walk away.

Yep. :)

Sadly, I don't have any internet connectivity on my Atari 8-bit.
(This is where a gadget like that ethernet gadget C=64 users have would
come in handy! :))

I've done a _little_ bit of R: programming on the Atari, years and years
ago. But no modem these days. I suppose I could do the web backend and
test it via Atari800 on my Linux laptop. :)

PS - If you've got a PC that you can install Linux onto, you can easily
install MySQL database, PHP scripting language, Apache or lighttpd webserver,

etc. etc. If the PC's got a serial port, you might be able to null-modem
across to the Atari via an Atari 850. Then set up a terminal on the
serial port that the Atari could 'dial into', which just acts as a front-end
to the webserver. Got a Pentium 133 handy? :)

That's one way of doing it, but if the game is slow enough (i.e., move-based versus realtime), than having each Atari (or whatever) occasionally poll for game state and report their users' moves via the webserver, then you can let your Apache webserver and MySQL database worry about the networking and keeping state.

AND (as I just mentioned), you can make a 'real' web front-end for PC users to play the game over the web. (And throw in crazy JavaScript, DHTML, etc. to make it more interactive.)

Raph Koster, lead designer for Ultima Online, said something like 'The
client is in the hands of the enemy!' They had to move all the stuff
like action delays to the server to keep people from doing things like
600 attacks a second.

Not a real problem I guess: Just server side layouts. I mean everyones
favorite games from Pac Man to AR used fixed layouts.

But the best would be matching layouts to squeeze more out of the
bandwidth and server. That way you could store the same layout locally
and not have to send it every time someone joins. Wouldn't use a lot of
processor ticks to calculate a random level either.

The Compucat BBS and I *think* current telnet BBS door games have
problems with multiple users. Too many dead brain cells ago but I seem
to recall something like you have to throw a small fortune at the
problem to get 200 users to connect to a telenet BBS simultaneously. So
web server is good if it can be hooked to an Atari. I don't even have a
shell account anymore so it kind of limits my thinking. I mean it could
be done in Lynx with a text only interface but who has a shell account
anymore, except you probably.

I mean you would have to reduce it down to the printable characters but
it would just shift the tokenizing a bit. i.e. ASCII for !" => 33, 34 =>
could mean Bill fires his BFG 9000 north. Maybe I am making a circular
argument trying to figure out what is easiest.

Been forever since I have had an Atari hooked up. Back to back long term
relationships that think Potpourri will fit where my Atari used to be if
only they throw it down a flight of stairs. *BUT* I went by a surplus
store and found an 130XE with PS for $5.99 so I am back in the real
Atari hardware world. I should know but don't what APE can do. I think
it emulates an 850 serial port but it would be getting to be a little to
much of a hack to hook into it.

I've got two K6 500 MHz laying around collecting dust. Probably a spare
AMD ~2600 if I look. I haven't worked with C or Linux since the early
90's so it would take me longer to learn the ropes then to program the
Atari. Well, I will get the Atari set up today and see what happens from

there.

That is actually generated on the server side. All the client sees is
html (assuming you're talking about the typical php-based forums; for
stuff like Facebook, the client is using Javascript to continue
communicating with the server after the initial page load).

I'm not sure how you would do this any of this on an Atari 8-bit though.
All the networking stuff that I'm familiar with requires TCP/IP.

Back when I did it for the 8-bit I tried to make it as high level as a real basic and had most of the commands you would normally see. Commands like Graphics 15 and POKE 82,0 were included so if need be it could be just text echoed. Even had a load binary and eXecute at memory address for doing things like installing character sets and running small assembly language programs.

I would say let Windows or a Linux box handle the TCP/IP stuff and just echo what's left. Hook the Atari to Intel box via it's serial port. I know new ones don't have serial ports so there is a short window here. A Mozzilla add on would be nice. It does sound like too much work though.

> anymore, except you probably.

Let's see. My Linux laptop, my Linux webserver, the Linux webserver
at work, and my ISP shell account (where I run Mutt to check my email
and Tin to read Usenet). That's it, these days. ;)

> I mean you would have to reduce it down to the printable characters but

> argument trying to figure out what is easiest.

Tired, so losing it, but remember that a webserver can echo binary
data (GIFs, JPEGs, PNGs, MP3s, MPEGs, etc. etc.)

A tool like 'curl' or 'links' or 'lynx' can easily dump the raw binary
data out to the terminal.

<snip>

Ooh... That's depressing. The situation I'm in is a very small house
we're renting, with a 2.5yr toddler roaming around. So my 800XL is stuck
in a drawer under the TV. He can't open the drawer yet, so it's safe
there. _And_ hooked up! :)

Once I get my/a 1200XL back from Bob Woolley, I may need to find somewhere
to set up a Man Cave so I can sit and code a little, now and then. :)

Again, the idea here is to use a modern server (e.g. a Linux box with
a webserver and maybe a database) to run the bulk of the game, and the
Ataris act as clients. They could do it over modem or serial->PC.

Apple would not allow this on iPhone. ;)

(Sorry, I had just read an article about a mighty fine looking C=64 emulator
for iPhone that Apple won't accept since it 'runs executable code.'
Despite a NUMBER of other emulator-based games being available.
Apple's being annoying and inconsistent.)

Yeah, I have no idea what a Windows users would use, to actually
make the Atari talk to the Internet. (I don't know, offhand, what
a Linux user would use, but I'm sure all the tools are there and
readily installable.)

If it can be done in Linux, it can be done in Windows. ;)

Actually, this reminds me of the project I encountered recently (but haven't yet tried) which enables you to play MULE with 4 players through the Internet, through one of the emulators available on Windows. But of course that would be different than what you have in mind.

BMV Property Deals
[Url:- http://www.publicangelmembership.com/kb/2009/05/bmv-property-deals/]

Despite the rather depressed state of today's economy, making money through proeprty is easier than ever before thanks to BMV property deals. Indeed, savvy investors know that now is definitely the time to scoop up some incredible deals. Many properties purchased today are sure to increase dramatically in value in a short amount of time - which means easy, amazing profits for people who act now. If you have never dealt with below market value properties before - or are a novice to BMV property investing in general - there are still many excellent ways for you to break in to this market.

Where To Find BMV Property Deals

Any problems that people may have in finding BMV property deals has less to due with a lack of available opportunities, and a lot more to do with a general lack of knowledge regarding where to find them. The climate of today's property market is a prime breeding ground for these types of opportunities, and more people than ever before are getting involved in these sorts of investments. But where are these great BMV property deals? The fact of the matter is, they are probably right under your nose.

BMV Property Deals - Hidden In Plain Sight

If you have little to no experience in property investing or in researching the current market, then you are likely to grow frustrated quite quickly on your search for BMV property deals. However, the surprising truth is that below market value property deals can be found in many different places. The trouble is, though, that their actual value and profit potential is not necessarily highlighted or brought easily to the attention of deal seekers. This is why BMV property agents who specialise in BMV property deals do such a brisk trade - they know where to look, and how to match investors with these incredible deals.

Using An Agent In Your Search For BMV Property Deals

Even if you think you have a bit of a handle on the property investment market, you could probably stand to use the help of a professional BMV property agent. Searching for true deals in the below market value property market can be time consuming - and incredibly frustrating. However, if you enlist the help of a qualified professional, you can get to the point much more quickly. However, what's the best way to find an agent who can really help you?

Get Help In Finding BMV Property Deals With A Proven Leader

Hundreds of satisfied customers have already enlisted the aid of http://www.PublicAngelMembership.com in their search for great BMV property deals. You can discover what all the fuss is about by joining them and receiving the best help available today in making amazing profits off of property. Why waste your time in trying to go it alone, or in searching through hundreds of BMV property agent listings?

Let the professionals at http://www.PublicAngelMembership.com assist you in your endeavour; the time and frustration you save is reason enough to do so.

Sorry I can't find the link now but a long while back there was a guy
who wanted to make a small web server. He got a Atmel AVR 8 pin micro
and dead bug hooked it up to an Intel box. At the time he was really
secretive about it. It was back in the days when speculation about
commercial prospects of the internet were running rampant. People were
talking about toasters with net connectivity so they could target market
Toaster Popups to people who used their toasters every morning.

Similar and probably something to keep Bill happy.

http://d116.com/ace/

This guy used Linux with Slip to hook up a different micro controller.
On that page he instructions how he did it and has links to a few other
hackers. It looks like he got it down to one chip in the final schematic
with a voltage regulator.

But yeah. If it can be done with Linux it can be done with Windows.
Thing is my recollection of Linux and BSD were that they were inherently
set up for multi users. Simple as pressing <alt> and a number key to add
another user/process.

He handled everything in ~1000 bytes of code but I don't want to go to
that level. Specifically the Atari hooked up as a simple console via the
serial ports may work. Get my drift? If you have an Atari hooked up to a
Linux box then you can run Lynx<or any of the other text based web
server software> on the Linux box to connect the Atari to any where/any
place on the web. Of course it would be better to have the same console
running from Windows because of the availability but I don't know if it

has the ability to do things like Lynx or use the serial port for a console. Seems like it should since you can hang things like keyboards off the USB port.

From what I understand SIO2PC with the Rverter drivers works fine as a serial port device. If that level of sophistication is too much, you can also run ~300 baud connection a with joystick hack and the MPP modem drivers.

I'd like to keep it as simple as possible. More of a demonstration project then anything else. I live in the boon docks so I'm still on dialup => means I will have to purchase a Linux CD if I don't want to download for 2 weeks.<grin>

Rick

So when do we get a stand-alone SIO2Ethernet or SIO2WiFi device?

Hey there!

Any 8 bit byters out there who have a game called 'An Evening of Horror"??

My friend wrote it in the 90s, and tried to sell it.....he sold exactly ONE (1)!!! Copy!

Unfortunately, the Master discs were lost. I recall the guy who bought it (A guy from Toronto, Ontario) was not the 'pirate' type. So, I hope that somehow, someone did make a copy of it, and it got distributed.

Anyone got a copy? The original purchaser? Please distribute this game!

Greetings from Japan! From the former Sysop of 'System Reset! BBS' Pro_Express Node 59.

Greetings to A.B.B.U.C. members Joost Kuep (I hope he is still around) and Wolfgang Burger!

3230. SIO2Ethernet or SIO2WiFi

Newsgroup: comp.sys.atari.8bit
Date: 2009-06-30 20:07:43 UTC
From: bill@newbreedsoftware.com
Message-ID: <4a4a708f$0$1593$742ec2ed@news.sonic.net>
Source record: 2169

So thinking a little more about what an SIO2Ethernet or SIO2WiFi would do...
I think a basic R: device could probably be sufficient enough.

The device itself could handle all of the TCP (and UDP?), and just looks like
another modem to the Atari. (Just as SIO2SD handles all of the SD device
and FAT filesystem management, and looks like a regular D: disk drive to
the Atari.)

Maybe you could 'dial' into IP addresses and ports. ATDT192.168.1.1:80 :)
Hostname lookups (via name server), and other setup (set IP address, set up
WiFi security, choose nameserver, etc.) could be handled via other
'modem commands'.

The idea is that a basic user could just fire up BobTerm or whatever
and use it to telnet to a shell server or one of the telnet-accessible
BBSes.

I suppose just looking at what tools like APE and Atari800 provide in terms
of R: support, and then providing all of that functionality (plus whatever's
needed to actually get ONTO a network -- stuff the PC running APE or Atari800
would already have) should be sufficient.

Later, more clever tools (like a basic text-based web browser --
something that does all of the host lookups and port 80 connections in
the background, and provides a UI for clicking links and entering data
into web forms) could be created.

The difficult thing would be encryption. (The SIO2xxx device could act
as a proxy, I suppose... you'd get plaintext between the Atari and
the device, over the SIO cable, but encryption between the SIO2xxx device
and the router or wireless access point (WAP).)

I, for one, would want SSH and HTTPS. :)

Mostly just dreaming... but heck, we've got SIO2SD and SIO2USB and
USB cartridges and all those other cool, clever stuff... Supporting the
Atari via tiny computers that are 200x as powerful makes a lot of cool
things possible.

(Or maybe I just need to buy a netbook ;))

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

Only one Copy sold???

I do recall a similar title, and think I have a copy of it in the
collection.

Back in the day, before the Net, I traded software with people all
over the world. It was really nice going to the Box and finding packages
full of floppies.8-)
Mostly games, and it was all good stuff.

I've never put any of it on the net. The Piracy Thing for one reason.
I'd like to do something with it of course, but don't need lawsuits.

If you have not found the game anywhere, then let me know and I'll open
the closely guarded archive treasure vault and see if it is there.

However, if only one copy sold, I will not release it without sometype of
agreement from the author.

3236. Floppy Disks

This place says they have them new:

http://www.floppydisk.com/

and B & C Computervisions has them in bulk, but I don't
believe they are new. I just bought 100 3.5 disks like
this.

Hope this helps Barry! :)

3238. Atari releases source to some Atari 7800 stuff!

Newsgroup: comp.sys.atari.8bit
Date: 2009-07-04 05:42:48 UTC
From: bill@newbreedsoftware.com
Message-ID: <4a4eebd8$0$1619$742ec2ed@news.sonic.net>
Source record: 2177
Cross-posted to: rec.games.video.atari,comp.sys.atari.8bit

Seen here:
http://www.programmerfish.com/source-code-of-several-7800-games-released/

"Atari has unofficially released source code of over 15 games for the
coders and enthusiasts to admire the state-of-the-art (because this is
what it was back then)."

That page lists:

* Robotron: 2084
* Xevious
* Dig Dug
* Centipede
* Joust
* Ms. Pac-Man
* Commando
* Crossbow
* Food Fight
* Galaga
* Hat Trick
* Desert Falcon (aka Sphinx aka Nile Flyer)
* Super Stunt Cycle (aka Motopsycho)

Plus links for:

* 7800 Base OS (NTSC)
* 7800 PAL OS
* 7800 Development System (Atari ST)
* 7800 Animation Tool (Atari ST)

Not sure if they're source or binary only. Also not sure what license
they're released under. I haven't downloaded any of it. (I'm not
an assembly programmer... I stick to Action! and BASIC on my Atari 8-bit.)

The files seem to be hosted at the 'programmerfish' server, so I'm not
sure whether the official 'home' for all of this stuff is supposed to
here, or if there's somewhere at an official Atari place that hosts it.

In any case... can someone port Galaga to the Atari 8-bit computer? ;)

They seem to come in commented source code, but no licence is included.
Unclear how "official" that is.

Greetings,
Thomas

I jumped the gun! Sorry :(

It was a dumpster dive, and this stuff was originally posted over
at Atari History Museum last month:

http://www.atarimuseum.com/videogames/consoles/7800/games/

Sadly, Slashdot picked up the post at Programmerfish (which is why,
suddenly, numerous friends started sending me that URL). I wasn't sure
I'd have time to dig around tonight, so posted that same URL here on
Usenet. (Even worse, they called it something nonsensical, like
"unofficial open source"... what the hell is that even supposed to mean?!)

Here's the news item about it at AHM:

http://www.atarimuseum.com/whatsnew/2009-JUN-11.html

So yeah, utilize at your own risk. (However, since Curt at AHM is
involved, I wonder if something's being done to make this 'official,'
considering his work on the Atari Flashback 2. (And, presumably,
all the licensing that needed to be done to get games onto that system.)

Anyone know? (I should ping Curt over on Facebook :))

OK I just finished scanning an PDFing the Action Manual. I did this
for my personal use. However I am willing to share if any one wants it.

BUT. before I do...
I seem to remember some one buying the FTE rights a year or two ago?
and I also remember some one selling new Action! carts. I have googled
and not got any valid hits, so perhaps this in not available any more.

Has any one got any objections to me posting the PDF manual here?
(about 11 Meg).

Galaga has been available for the 8-bit for along time,
I know that some of the games for either the 5200 or 7800 were ported,
not sure which they came from, maybe both.

I don't recall Galaga being released for any Atari except the 7800.
I never heard that it was ported.

You're not thinking of Galaxian, are you?

Hello David,

What is the total file size of your PDFs?
I have been working on entering the ACTION! manual for my ACTION web
site but I won't be putting any copy online if the owners object.

I have recently put a copy of Larry Serflaten's 21-part ACTION!
tutorial on my site.
http://joyfulcoder.net/atari/action/

Thanks,
Eric

about 11MB

The scans I originally took were TIFF, I cut the file size down to half
by converting them to PNGs. I used the PNGs for make the PDF.

BTW Using JPEGS did no help file size, for clear quality they were
bigger than the TIFFs:(

3247. Atari 1200XL vs Dell Inspiron 1525 laptop

Here's my comparison, with some backstory, a chart (with many values in
both '1982' and '2009' terms), and some photos.

http://www.newbreedsoftware.com/bill/photos/atari1200xl_vs_dellinspiron1525/

I'm just continuing the tradition of stacking two pieces of hardware on
top of each other, and then photographing them and comparing their specs. :)
They just happen to have been born ~27 years apart.

No, I know both titles. Some of those games do tell from which system they
were ported when they load up. Without looking I don't remember from which
system they came. Both were originally coin-ops like Xevious was right?

Also, I think some were from the 2600.

That's because JPG is design for photos not scans of pages. You'd be better off converting to GIF and reducing the colour count.

From: DocRotCod <rahbart@cox.net>
Message-ID: <Wwd5m.30633$ob.11383@newsfe13.iad>
Source record: 2190

I took the BBS down several years ago due to aging hardware. I am now using an updated MIO with a new 18GB SCSI hard drive so the BBS has been reborn.

I have moved the old message bases to an archive format. There is 1 file area open. I have ATASCII movies and online games.

Some of the text files are a bit out of whack but the BBS is up if you all wish to check it out.

telnet to thecafe.dtdns.net 8888

You will need to create a new user as I have initialized the userlog.

Thanks!

3255. Atari800 on GP2X

Newsgroup: comp.sys.atari.8bit
Date: 2009-07-10 06:58:58 UTC
From: bill@newbreedsoftware.com
Message-ID: <4a56e6b2$0$1641$742ec2ed@news.sonic.net>
Source record: 2194

Ok, so I got an original model GP2X, a handheld game system (happens to be
Linux-based and very easy to do homebrew game development on), and one of
the first things I installed was Atari800.

I now have portable, in-my-hands "Yoomp!" and "Gem Drop." This is awesome. :)
(I've also got a breakout board that lets me connect to S-Video and audio
on my TV, but Atari800 seems to run in a mode that causes it to be squished
on TV-out. Looks fine on the LCD.)

Surprisingly, my SuperIRG flickery mode in Gem Drop looks pretty good
(esp. wehn Atari800 is in PAL mode).

Gamepark Holdings has a new model out, the GP2X Wiz, which is OLED and
touch-screen and includes a 500+MHz CPU and 3D acceleration. Looks like it's
only $180. (I paid $75 for the GP2X, including the breakout board,
a 2GB SD memory card, and a carrying couch. And it came with the original box.
No idea what it was all worth new.)

Entering text in Atari800 on the GP2X is finicky, but they've provided
a firebutton+arrow menu that appears on the left side of the screen to
let you tap things in. Since some games require random keypresses now
and then, this is a lot better than NO keyboard. I bet an onscreen keyboard
for the touch-screen model GP2Xs would be a lot easier to use, though.
(It'd also help if you had the option of pausing emulation until you figure
out the keypress. ;) "Gauntlet" (the space game) uses [X] to stop the ship.
So far, I've found it almost impossible to deal with. ;))

So how do you find the GP2X as a System?
what is the build quality like, battery life etc?

I was looking at buying one a few yeards ago now

I also think the system is a really good fit for a lynx emulator.

System seems solid. I haven't had it long enough to tell batt life.
(I'm also using an _old_ pair of NiMHs, which don't seem to last very long
in my digital camera.)

> I was looking at buying one a few yeards ago now

The next model (F200?) looks like it does touch-screen.
The latest model (Wiz) is touch-screen, OLED (!!!), 3D accel'd and has
a much faster CPU. And then there's the OpenPandora.
Beggars can't be choosers, though. ;)

> I also think the system is a really good fit for a lynx emulator.

There is a Lynx emulator, but I haven't tried it. Only the Stella and
Atari800 ports. (The latter is a bit different from the Atari800 I'm
used to on a Linux desktop/laptop, though... what with the D-Pad-controlled
keyboard entry menu. I don't use Stella enough to tell how diff. it is.)

Gotta run,

-bill!

3260. SDX Cart CleanUp

Newsgroup: comp.sys.atari.8bit

Source record: 2199

A while back, there was a real mess with a SDX cartridge that was
splattered for everyone to see.

Just for the record, that cartridge was sent back to the person who claimed
it by US Insured Mail. The Post Mark on the Receipt that I hold in my hand
is OCT. 08, 2008. The Cartridge was returned in working condition.
I never received a receipt for the signature of the package.

To this Date, which is July 11, 2009. I have not had any e-mail, snail mail
or
Posting that the cartridge arrived.

I did my part.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

3262. FS: AtariMax MyIDE cart ($30 OBO + shipping)

Newsgroup: comp.sys.atari.8bit
Date: 2009-07-15 20:11:34 UTC
From: bill@newbreedsoftware.com
Message-ID: <4a5e37f6$0$1584$742ec2ed@news.sonic.net>
Source record: 2051

Considering my current home office situation (nonexistent), and
the flexibility of the SIO2SD I bought recently, I've decided I'll probably
never fully utilize the MyIDE setup I cobbled together. It needs a better
home.

New ones are about $50, and this one should still be in pretty good
condition, so I'm asking $30 (or best offer), plus shipping.
(I'm in Davis, Calif., and will probably just use USPS.)

Thanks!

> I have not as yet receivd it.

I'm not sure how compatible the Pandora is supposed to be with the GP2Xes, but I'm betting that, at the least, an Atari800 port should be relatively trivial. (At least, no harder than it was to get onto the GP2X.)

<thread poaching alert>

Speaking of which, if anyone has any spare SX212/XEP80 cases to get rid of,
I could use a couple. :) If you do, feel free to drop me a line by
reversing each segment of my public email address.

3274. Antic Magazines for sale, Syracuse, NY area

Newsgroup: comp.sys.atari.8bit
Date: 2009-07-22 18:38:51 UTC
From: Chris <cchiesa1@twcny.rr.com>
Message-ID: <13f61296-4e6e-4ee1-aa1a-a691f3b35460@r36g2000vbn.googlegroups.com>
Source record: 2063

I'm posting this via Google Groups because that's what I have access to. If anyone is willing/able to crosspost this to the bona fide Usenet, please e-mail me (don't just DO it, I don't want five of you doing it and flooding the 'net). Thanks!

For sale: 74 issues of Antic magazine; 84 issues counting duplicate and triplicate issues. Complete volumes 3-6, partial volumes 1, 2, 7, and 8.

$50 or best offer

Detailed list:

Vol 1: iss 1-5
Vol 2: iss 4, 5, 7-12
Vol 3: iss 1-12
Vol 4: iss 1-12, w/ duplicate of iss 9
Vol 5: iss 1-12, w/duplicates of iss 9 and 11, and triplicate of issue 10
Vol 6: iss 1-12, w/duplicate of iss 6
Vol 7: iss 1-10, 12, w/duplicates of iss 1, 3, and 8
Vol 8: iss 1-3

I can probably be convinced to ship these if you pay shipping and are willing to wait for me to get around to it; otherwise it would be vastly preferable if you can come and pick them up.

Cheers,

Chris

Last-modified: June 6, 2009

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

3281. RS232 from Atari 65XE

Newsgroup: comp.sys.atari.8bit
Date: 2009-07-24 18:22:33 UTC
From: The Ultimate Failure <leet91@gmail.com>

Hello, I'm not sure if this is the right place to post this question, but I thought that the Atari 65XE was an 8-bit machine (right?) so here must be somewhere that I could ask...

Anyway, I have an Atari 65XE, which only has AtariBASIC on - I have no cartridges or anything. I was wondering if it was possible to get RS232 r/w access to a PC from the Atari, which would mean some special adapter because it only has an SIO port.

I did some searching online, and I came across APE and SIO2PC - which both seem to do things that I do not require, I only need to have r/w access (from BASIC preferably) to an rs232 serial port so that I could connect the Atari to another box with a null-modem cable (and maybe use it as a dumb-terminal?)

...Is this possible with my hardware, and if so how would I access the port from BASIC?

Thanks,
-- Me

The Atari 8 bits don't have a RS232 port; the signal levels are 0 and
+5V, whereas RS-232 uses +12V and -12V. IOW, you would need some type of
an interface to communicate with the PC.

The traditional way is the 850 serial interface (or the 850XL by a third
vendor) which features a "true" RS-232 interface and a handler ("R:").

The considerably simpler APE or SIO2PC solutions consist only of a
single chip that does the level conversions, nothing else, which means
you would need to program the hardware directly (POKEY, namely).
However, without such chips you cannot interface to RS232 reliably.

So long,
Thomas

There was a device called the R-Verter which was almost the same as SIO2PC.
Back in the day I used to use one to connect a modem to my Atari.

Echoing what Thomas and Bill said a bit. You are going to need
something to interface if for no other reason then something with
compatible plugs on both ends.

The SIO2PC is what most people consider the best bang for the buck. Even
at that you still need a compatible plug for the Atari side. If a couple
of cables for hooking up things like a disk drive or cassette didn't
come with your set up, you are kind of SOL. You could build one for less
then $6 if you had a spare Atari cable.

I'm setting up a system after a long layoff so I will check if the
SIO2PC cable will work with the RVerter handler. It is rumored to anyway.

There is one other option I can think of. I hacked a simple cable that
hung off a joystick port that worked with the MPP modem handlers. You
would need to buy a couple of 9 pin plugs, some wire, a resistor, and a
zener diode IIRC. You are limited to ~300 BAUD and properly cabled it
worked with a Hayes compatible modem and a couple of software packages.

Rick

You need a R: handler to access a RS232 port. The port would have to
be on a 850, PRC, MIO, Black Box, which are much more expensive
than a SIO2PC adapter. You probably need a disk drive as well as
the 850 R: handler needs to load at boot. It may be possible to
write the PRC handler in BASIC DATA statements and POKE
it in from a BASIC program, that may work.
So, let's say you have a PRC, can load the R: handler from BASIC.
Then the following program would be OK at 300 baud to operate
your null modem.
******************************
10 CLOSE #2:OPEN #2,4,0,"K:":REM open K: for read
20 CLOSE #3:OPEN #3,13,0,"R:":REM open R: for concurrent read/write
30 CLOSE #4:OPEN #4,8,0,"E:":REM open E: for write to screen
40 XIO 34,#3,192+48+3,0,"R:":REM turn on DTR,RTS,XMT
50 XIO 40,#3,0,0,"R:":REM Open R: for concurrent mode
60 XIO 36,#3,0,0,"R:":REM MUST BE 300, PROG. TOO SLOW FOR 1200 OR
HIGHER
100 STATUS #3,AVAR:REM causes 747 to retrieve from R:, I think, not
sure
110 IF PEEK(747)=0 THEN 200:REM number of chars in input buffer
120 GET #3,CHAR:REM if 747 <> 0 then get the char
122 IF CHAR=0 OR CHAR=10 THEN 200:REM discard ASCII 0 and 10
```

```
124 IF CHAR=13 THEN CHAR=155:REM translate ASCII linefeed to ATASCII
130 PUT #4,CHAR:REM send char to E:
200 IF PEEK(764)=255 THEN 100:REM if 255 then no key been pressed
210 GET #2,KEY:REM key pressed, get the char
212 IF KEY=155 THEN KEY=13:REM if linefeed then translate to ASCII
220 PUT #3,KEY:REM send char to Rn:
240 GOTO 100:REM start all over
250 REM R: is for R1:, you could also specify R2:, I think
```

3291. Some video file -> Atari thoughts

Newsgroup: comp.sys.atari.8bit
Date: 2009-08-01 21:29:58 UTC
From: bill@newbreedsoftware.com
Message-ID: <4a74b3d6$0$1617$742ec2ed@news.sonic.net>
Source record: 2080

So I saw a highly amusing video on YouTube the other day:

http://www.youtube.com/watch?v=I1qHVVbYG8Y

It's a cartoon, black on a white background, with not a ton of
detail, and motion that's usually focused on one small area.
I decided it'd be perfect to try and convert to something you could
watch on an Atari. :)

I used 'mplayer' on Linux, with the option '-vo png'
(aka "video out: save each frame as a separate PNG file") to extract
the frames.

Then I created a shell script that iterated every other frame (just to
keep the size down) and used some NetPBM tools to do the following:

(1) scale the frame to 160x180
(the video, shrunk down to 320px wide, was 180 tall;
but I'm targetting GRAPHICS 15 (aka 7.5), so needed it 1/2 as wide)

pngtopnm png/$j.png | pnmscale -xsize=160 -ysize=180

(2) map the colors to 4 shades of grey, using a small 2x2 image I made:

ppmquant -mapfile grey_palette.pgm

(3) cut out the left/right borders; I want to display in a narrow playfield,
and most of the action in the cartoon is toward the center

pnmcut -left 32 -width 128

(4) convert the file to a Portable Greymap (.pgm), which is 1 byte per pixel
(rather than 3 bytes, like a Portable Pixmap (.ppm))

(5) compare the current frame to the previous frame, getting the difference

pnmarith -difference gr15/$oldj.pgm gr15/$j.pgm > diff.pnm

(6a) crop any solid border from the 'difference'; I do this to get the
position and dimensions of "what has changed", which I'll crop out of
the actual current frame in step 7

pnmcrop -verbose diff.pnm > crop.pnm 2> crop.txt

(6b) determine the dimensions; if nothing was cropped, we know that the
boundaries of what has changed includes the entire size of the frame

allbkgd=`grep "The image is entirely background" crop.tt | cut -d ":" -f 1`
if ["$allbgkd" = "pnmcrop"]; then

```
top=0
bottom=179
left=0
right=124
else
top=`grep "off the top" crop.txt | cut -d " " -f 3`
if [ "$top" = "" ]; then
top=0
fi
# ... etc.
```

(7) calculate the position and size of the crop; keeping in mind that
we get 4 pixels per byte in GRAPHICS 15 mode:

```
left=`expr \( $left / 4 \) \* 4`
right=`expr \( $right / 4 \) \* 4`
width=`expr 128 - $right - $left`
height=`expr 180 - $bottom - $top`
```

(8) crop the current frame, to get the delta frame that we'll actually
store:

```
pnmcut -top $top -height $height -left $left -width -$width gr15/$j.pgm > crop.pgm
```

(9) finally, add that image to a 'stream' of data that the Atari will load
and display; also need to tell it where, on the screen, to load into!

```
./add_to_stream $left $top crop.pgm >> stream.dat
```

And "add_to_stream" is a little C program I wrote that dumps a few bytes
of info, followed by data for a GRAPHICS 15 display. It gets appended to
the 'stream.dat' file, via the ">>" in the shell command, above.

(1) Determing starting position (relative to the top of screen memory):

```
left = atoi(argv[1]);
top = atoi(argv[2]);

start = (top * 128 + left) / 4;
start_lsb = start % 256;
start_msb = start / 256;
```

(2) open the PGM image file, read its dimensions

```
fi = fopen(argv[3], "r");
fscanf(fi, "%s %d %d %s", tmp, &width, &height, tmp);
```

(3) write the position and size of data, so the Atari knows how much to
read, and where to put it on the screen:

```
fwrite(&start_lsb, 1, 1, stdout);
fwrite(&start_msb, 1, 1, stdout);
w = width / 4;
fwrite(&w, 1, 1 ,stdout);
fwrite(&height, 1, 1, stdout);
```

(4) read all of the PGM data, convert it to GRAPHICS 15, and spit it out:

```
for (y = 0; y < height; y++) {
fread(data, 1, width, fi);
for (x = 0; x < width; x = x + 4) {
p1 = data[x] / 64;
p2 = data[x + 1] / 64;
p3 = data[x + 2] / 64;
p4 = data[x + 3] / 64;
p = (p1 << 6) + (p2 << 4) + (p3 << 2) + p4;
fwrite(&p, 1, 1, stdout);
}
}
```

And finally, so far, I've written a TurboBASIC XL program that mostly works,
though it's slow, and I haven't set up a proper display list to get
all of the GRAPHICS 15 display working in narrow mode. Tips welcome! :)

```
10 GRAPHICS 31
15 POKE 708,5:POKE 709,10:POKE 710,15:POKE 712,0
20 REM POKE 559,33
30 SC=DPEEK(88)
31 REM SET UP DL HERE
40 OPEN #1,4,0,"D:STREAM.DAT"
50 GET #1,SL:GET #1,SM:S=(SM*256)+SL
51 X=(S MOD 32):Y=INT(S/32):S=(Y*40)+X:REM WORKAROUND UNTIL NARROW SUPPORT
60 GET #1,W:GET #1,H
70 FOR Y=0 TO H-1
80 BGET #1,SC+S+Y*40,W:REM WOULD BE 32 IN NARROW
90 NEXT Y
99 GOTO 50
```

I need to do the following:

* Figure out GRAPHICS 15 display list in narrow playfield mode
* Figure out a way to make a very large (~512KB) ATR disk image
(and/or skip more frames from the original video,
and/or apply some kind of RLE or other compression?)
* Figure out my 1200XL's 512KB RAM disk in MyDOS :)
* Rewrite the viewer in Action!

Although, sadly, I doubt I could redistribute the video. Just fun project
for myself. ;)

But hey, with the appropriate tools (youtube-dl, netbpm, bash, and a C
compiler), anyone could take the same video (or others) off of YouTube
and figure it out themselves.

Should I set up a page with downloads for the actual shell script and
C and Atari (TBXL and/or Action!) source?

<snip>

Oh, and limit the framerate. :) (Some frame diffs are very, very small.
In 'no change' cases, I store 1 byte, though I suppose I can just store
a 0x0 dimension, and the loader should not try to read anything. Duh! :))

2009.03.05 added Avery Lee (Altirra 1.0)
2009.03.02 deleted: MacFalkner (web site gone, thanks Laurent)

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry should contain a valid postal address or web page address.

Unless explicitly requested by the vendor, no entries will include an email address due to the overwhelming amount of spam that would result.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Archive-name: atari-8-bit/welcome
Posting-Frequency: 10 days
Last-modified: June 6, 2009

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

Heh. I like Ben well enough. (He also helped with my Atari Party by
loading me some sticks.)

However, I never see his posts here. Killfiles can be your friend. ;)
(Sorry Ben!)

--

Here here. Unfortunately, I'm afraid Ben's doing himself a disservice by
pushing potential buyers to take the killfile approach. If there really
was something new and interesting going on at his end, I wouldn't know
about it because I no longer see anything relating to his business either
until someone else posts a thread like this.

>(Sorry Ben!)

Ben is a good guy.

By typical day to day / internet standards, his advertisements are nothing but a drop in the bucket compared to what we are inundated with.

By usenet old computer nerd group standards, it's a bit on the frequent side ;) Still not egregious though.

BUT, it doesn't bother me. In fact, it was one of these ads that led me to purchase a pristine, cream puff of an 800XL w/accessories from him a couple years ago.

I could call him at 3AM and end up in an atari b/s conversation. Kinda fun actually.

I will be buying my forthcoming 130XE from Ben as well.

So yeah, some don't like the frequency of his ads, but in the grand scheme, it's not that bad. He does good business and has a good heart.

I was a bit bored this morning so I thought I would check. Counted ~960 messages on my news reader of which ~100 were from Ben. Dates ran from 4-16-2008 to current or about two per week. It has climbed from 1 per week to 3-4. For comparison I had about 50 in the same time period and you had ~66. I think google has a statistics feature for posting frequency et cetera but I think I am satisfied with my current level of info.

Odd statement on the current level of 8 bit development. I have a good excuse, death in the family, but I really have to get busy writing that

slip handler. I figure looking up this stuff was the last throws of procrastination for me.

Rick

I've talked to, and bought from Ben as well. Good guy, just a bit
over-zealous with the posting. :)

I'd rather see his posts than the usual porn/sex adds and Sin<youknowwho>.
Don't want to mention his full name - I figure it would invoke him somehow.

:D

Bees on the what, now?

My day job and family (and Tux Paint and my LUG) keep me WAY too busy.
Aching to crank some Action! out, though.

But some days I just feel like I'm not a very good programmer, so I want
some rocket-surgeon to write my games for me. I'm full of ideas -- both
in term of the gameplay, and how to convince the Atari hardware to do it.

I should hang out on the AtariAge forums, but... I hate web forums.
Give me email or usenet any day. :(

It will be day late and a dollar short as the saying goes. I hear MS is leaving Slip out of Vista. Even for linux you have to compile a kernal that includes it IIRC.

But there still are some tutorials on the web for setting up an XP box serial port for a slip connection so it is worth a try. I will just translate what I can from http://www.faqs.org/rfcs/rfc1055.html

The routines presented there appear to be just subs with no main control loop.

BTW: What you are looking for is a job as 'a game designer'. Raph Koster is worth a google search to see what the guy behind Ultima Online and Star Wars Galaxies is about. I think you still have to do some grunt work to climb the corporate ladder. He got his experience and chance from his experience with MUDs.

Rick

Yeah, I have too many delicious items on my resume like "C", "BREW", "J2ME",
so recruiters are constantly bugging me about development positions.

Really -- and no big surprise here -- my dream job would be design
(and probably also some development) in educational games. However, my
current day-job is fun ... doing web stuff to help change the world of
independent ebook publishing. :)

Last-modified: June 6, 2009

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

I have an 800XL and a Floppy drive for it, but not cables.

Are the cables just straight across for it? no switching of wires
anywhere? I can make one no problem, just dont' want to have
something going to the wrong place.

thanks

good info here:
http://www.allpinouts.org/index.php/ATARI_8_bit_Serial_Input/Output_(SIO)
THE SERIAL CONNECTOR

The serial connectors on the computer and all peripherials are
identical. Nearly all peripherials have two serial connectors.
Either connector may be used for any connection. The serial bus is
designed so that peripherials can be daisy-chained together. The
following is a diagram of the serial connector.

The serial connector pin-out

```
1 1
2 4 6 8 0 2
-----------
/o o o o o o\
/o o o o o o o\
-----------------
1 3 5 7 9 1 1
1 3
```

1 clock in (to computer)
2 clock out
3 data in
4 GND
5 data out
6 GND
7 command (active low)
8 cassette motor control
9 proceed (active low)
10 +5V/ready
11 audio in
12 +12V (400/800)
13 interrupt (active low)

Proceed goes to pin 40 (CA1) of the PIA. It is not used by present
peripherials.

Interrupt goes to pin 18 (CB1) of the PIA. It is not used by present
peripherials.

Pin 10 doubles as a 50mA +5V peripharal power supply and a computer
ready signal.

A comment here. Ben never replied to my post. I musta been on Ben's
killfile, or he just doesn't read, just posts, or something.
AND.... I started about the biggest thread in my usenet experience.

You need cables, try Best Electronics or B&C Computers. They
will fix you up.

Wow.. It's been a long time since I've been here. Most of my 8bit hardware has been parted out, but I have
enough remaining (including emulators) to still be functional.

Unreal how much software, books and manuals I still have buried in my basement.

Any BBS's still running on 8bits accessible via Telnet/ssh? Trying to get back onto Darkforce now but am having
emulation issues.

3323. 6809 CPU in 8-bit Atari's?

Newsgroup: comp.sys.atari.8bit

Would it be possible to replace the Atari's 6502 with a Motorola 6809? I understand both the 6502 and the 6809 were derived from the earlier 6800 CPU. I know the two aren't binary compatible, but are they electrically compatible?

I remember reading about a 6809 board for the Apple II, so I was wondering if the same was possible for the Atari...

I'm not sure if it would play nice with the ANTIC chip but electrical
compatibility with other chips from memory to PIA should be OK. Our
6502's have either a couple of chips or built into later processors a
mode that isolates them from the buss so the ANTIC chip has full control.

Rick

Assuming the ANTIC chip doesn't pose any problems, would this be a major
project? Would it involve much more than creating a new socket for the 6809?

I think it would be neat to get OS9 to run on the Atari. It's a
multi-tasking operating system that is very similar to Unix. An 8-bit Atari
with a 6809 should be able to handle it.

The 6809 is a fine processor.

There is the Contiki port to the 6502 but I think support was dropped
for the Atari after version 1.x or so.
http://en.wikipedia.org/wiki/Contiki

It has caught on but from the looks of things, mostly with the embedded
controller types.
```

I can't speak for anybody, that being said: It seems like 1) Most people don't want to use C for programming their Atari. 2) Space is at a premium so the Atari gets replaced by a more capable computer for things like email and web browsing => lot of people on emulators if they do still use Atari software.

I think most people with a real Atari have some flavor of interface like SIO2PC which makes makes a suitable bridge to a PC/Internet.

I'm an adequate C programmer or at least I used to be. I also learned machine language before any higher level languages like BASIC. Right now if I program on the Atari I prefer Action! while others are "assembly or die!" or BASIC or what have you. I just can't think of a compelling reason to learn Contiki or go to C programming which is a step backwards for me.

Right now we don't have a new killer application that is a must run on an Atari. No VisiCalc or Lotus 123 or Word Perfect. We are still stuck with 40 column screens in two colors so it is unlikely we will see a new application that requires multitasking and internet access.

Rick

It would be a major project aside from ANTIC compatability issues,
wiring in a new socket for the 6809 would just be the beginning place
to start.

Considering the end result desired it might be better if you learned
to speak 6502 and then translated the OS9 code to work on the Atari 8-
bit as is. The bulk of the headache would then be code - why not make
it an all code headache and leave the hardware issues behind? Of
course in the translation of OS9 from 6809 to 6502 would be the re-
arraignment of the two system's hardware registers, but again done all
within code.

No soldering iron smoke with this approach and maybe that's what you really wanted to do in the first place? I'm not wild about OS9 and don't even know how big it is to start with, so I probably won't be in on the project - good luck.

The 6809 has a few features that might be useful for other things, not just OS9. It has three 16-bit registers and has position independent code so it can be relocated without modifying code. The 6502 can't do that. It also has a hardware multiply mode. It's also source compatible (not binary) with the 6800, a relative of the 6502.

A shorter route to a better processor in the Atari would have been the 65802. Lots of things puzzle me like why the 65802 was never a success. Even if it wasn't a direct replacement in Atari or C64<6502C and 6510?> there were literally millions of Apple II it could be plugged into.

It seems to be platform dependent. People went nuts upgrading processors in clones to V20, V30, AMD, et cetera. We did have two 65816 boards but they never achieved a good market share.

Intellectually<sic> I know you could write some good code with things like the ability to branch anywhere in 64k and block moves would be ~5X as fast. The pragmatist in me say: A major problem with the current 6502C are screen and RS232 only works at ~300 BAUD in BASIC. Even if you rewrote BASIC and the OS for any new processor you would still be lucky to get maybe 1200 BAUD which is still pretty weak. BASIC is where most people live. Too many people are used to DSL and USB speeds now.

Rick

From http://www.atariarchives.org/cfn/05/11/0208.php

What is a 65802? It's another processor From Western Design Center that
has all the extra opcodes of the 65C02 plus extras, like move memory
commands, stack relative addressing, and the ability to set the
Accumulator and/or the X and Y registers to 16 bits. The nice thing
about the 65802 is that it is "Plug compatible" with the 6502 and 65C02,
meaning you can pull out a 65C02 from an existing system, and plug in
the 65802 and it will work. The 65802 has two modes, emulation and
native mode. In emulation mode, the processor acts just likea 65C02
with all the extra opcodes. In Native mode, the registers can be
changed to 16 bits. There are some other more technical differences,
but probably not worth mentioning them here.

I wonder if it might be possible to modify an 8-bit Atari so it could accept
a 65802 CPU?

If not, would it be possible to take a 65802 FPGA and modify it so that it
would work in a 6502C socket?

http://en.wikipedia.org/wiki/Field-programmable_gate_array

The big question of course is - are there enough 8-bit Atari users left to
make such a project worthwhile?

There may be a window of opportunity. What has happened is eBay resulted in pretty good sales for j113<?> of just under 3,000 SIO2PC cables and I see Atarimax which I assume is either Steve Tucker or at least a marketing connection is close behind at ~2,000 of his mixed product lines. I doubt if there are 200 active members in any forum including this one but it does seem like there are thousands of them looking on eBay.

I do have an old 800 with a 65C02 chip in it. There were two types of processors used in the 800, the 6502B which used a different personality board that included the ability to halt the processor and a later board that came with a 6502C that included the !HALT line on the processor.

If you are really bored the Atari Technical Reference has the original schematic for the 6502B and with the 800XL schematic<6502C> you can tell which parts are missing. I recall only about 3 ttl chips are replaced.

I've heard it both ways in that all you have to do is replace the 6502B in the original 800 so equipped with a 65802 and it will work and someone else said it doesn't generate the same clock phases as a 6502B so it won't work. I actually bought a 65802 off eBay but the little woman in one of her "all your junk is crap" moods may have tossed it.

I've also heard you could just add the 3 chips to a 65816 to make a daughter board for replacing the processor in an 800XL.

Heck, I have been puttering around a bit lately. Found a couple of decaying SIO2PC cables and have a couple of 130XE that work. I plan on setting up a system for fooling around. If the price is <$100 I would be a customer.

I jump around a lot though. Right now I have been looking at
http://sbc.rictor.org/sbc31/info.html
This board seems interesting to me on several levels. In and of itself I like the 320 X 200 X 8bit display and hardware. 640 X would be better of course. I'm thinking this may be my next computer/time burner.

Rick

3340. atari++ 1.57 ready for download

Newsgroup: comp.sys.atari.8bit
Date: 2009-08-19 08:38:05 UTC
From: Thomas Richter <thor@math.tu-berlin.de>
Message-ID: <h6gdg4$6kj$1@infosun2.rus.uni-stuttgart.de>
Source record: 2129

Hi folks,

please find a new version of atari++, the atari 8 bit emulator, available for download.
Note that this is the new web-page, at:

http://www.xl-project.com/

From the README:

Atari++ 1.57
- Fixed a couple of issues in the GUI, specifically when entering
data into string gadgets.
- Fixed again a couple of exception handling issues in the menau.
- Made the keypad stick configurable, the keys for joystick emulation
are now part of the configuration.
- Added a dummy front-end, "NONE", that does not render anything to
the screen.
- This release supports .CAS images; however, they are not part of a C:
(tape) emulation, but emulated as disks. Depending on the contents of
the tape archive, the disk is either considered a boot disk, a binary
or a basic file.
- This release supports better disk support for BASIC and MAC/65 files.
If you insert such a file into the emulated disk drive, the emulator
will build a DOS 2.0S compatible disk structure around it and you can
load the image from the emulated disk as D:PROGRAM.BAS or D:PROGRAM.ASM.
Note that such disks are *not* bootable, you first need to boot, and
then turn on the emulated disk drive.

It should also fix the keyboard issues in Action!.

Have fun,
Thomas

3341. Atari version of the C-One?

I read a few years ago that when Jeri Ellsworth was finished with the C-One, she would make a similar unit for the 8-bit Atari's. Is this still going to happen?

Oh, if I had known that, I would've had something more to talk about
than just "oh hi!" :) when I saw her at California Extreme last month. ;)

There was also the Atari Flashback 3, which was going to be an
Atari 8-bit gaming system. I guess that got canned...? Anyone know the
details?

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

Right before I gave up using an Atari for my primary computer and switched to a PC, software came out for both 80 columns (I know there was hardware available for it, but this was actually done in software using graphics 9, if I remember right - it's been over 20 years) and task switching. As I recall, they both worked rather well. Of course, now I can't remember what either one was called... :(

OMNIMon or something? Or wait, was that the hardware one?

There are two very fast software-driven ways of doing 80 columns,
each used by different modem/terminal software programs.

One utilizes a pair of GRAPHICS 0 40 column text screens, and
a pair of character set fonts. One with text on the left half,
the other with text on the right half. Laying the text out
in memory proplery and flickering between the two chunks of
text data and two pairs of fonts, and you get a (flickery) 80
column mode that only costs you 4KB. (1KB each per font, and
<2KB for the 80x24 of text.)

That's Flick80 mode, used in FlickerTerm, if I'm remembering
the names right.

Then there's a variaton on the old-style GRAPHICS 8 mode,
where text is blitted into 4x8 areas of pixel data within
a 320x192 playfield. Except when you go to scroll the
screen up (due to new text at the bottom), rather than move
nearly 8KB of screen data, it merely wipes out the topmost
line of text, and re-orders the Display List to put that
line at the bottom, and push all the others up 8 pixels.

It scrolls a LOT quicker than normal GR.8-based 80 col
text drivers.

That was used in Ice-T. (Not sure if Itay ever made
a separate driver you could Binary [L]oad and use
for the E: driver. There was one based on Flick80 mode,
though!)

Yes, I have Omnimon and actually wrote an 80 column terminal program with my own screen handler for one of my buddies that needed to access the mainframe at work using his Atari at home.

Problem is you need to use an 8X4 vs. 8X8 character set so it sucks as far as legibility goes. 1<one> vs. l<lc L> for instance.

I've been on an odd kick lately. I just committed to buy one of those 65816 SBC computers I posted the link to so I have been trying to figure out how it works. The graphics chip it uses was derived from http://elm-chan.org/works/crtc/report.html

I *think* I have this right: The designer of the 65816 SBC, Daryl, says it will also do ~VGA with more processor overhead. Looking at the original display link IMO it would be a trivial hack to put it in an Atari. One of the things Daryl did was interlace memory access between the display chip and the processor. I'm not sure if that is why he made several design decisions like only using a 7mHz clock on his SBC but it would seem to make sense.

Overall I am happy. By that I mean the SBC is roughly equivalent to an STE [7mHz 65816 ~= 16mHz 68000, 512k memory, 256 colors in 320x200 display, et cetera]. I will be able to redo the Action! run time package to take advantage of the 65816 instruction set which for things like block moves should be 15X as fast as our 6502. Not that I would do it, but a person could do a faithful Dungeon Master clone.

Anything on top of that would be gravy. I mean if I do actually hook one of those display chips into an 8bit most of what I want will be available, just slower. The original display had a 1mbit or 128kb which

should be plenty good for at least static displays. I've been pretty much out of touch with other hackers for two decades so I would have to make new friends with access to FPGA programmers.<grin>

Rick

Due to the flickering in Flick80 mode, you can actually get away with
4-pixel-wide characters. They don't mush up against each other quite
the same way as they do when you're not flickering.

e.g., if you made a 4-px-wide "N"

```
# #
## #
## #
# ##
# ##
# #
# #
```

and put two of them together, it looks like this in a normal
(say, GRAPHICS 8) bitmap mode:

```
# ## #
## ### #
## ### #
# ### ##
# ### ##
# ## #
# ## #
```

But in Flick80 mode, you perceive this sub-pixel-wide gap between them,
since they're never actually touching:

```
# #|# #
## #|## #
## #|## #
# ##|# ##
# ##|# ##
# #|# #
# #|# #
```

(My ASCII representation isn't really doing the effect justice. ;)
But trust me, it's there.)

I was recently reading about a trick in GRAPHICS 0 mode whereby you could
get a 40x32 (?) grid of text. Each character in the font is 6 pixels tall,
but you can somehow convince ANTIC and/or GTIA to only show those 6 scanlines
per line of text.

It was used in some music composing program. I think it was discussed here recently, or maybe I read about it on some web forum (AtariAge?). :^/

I'm fond of the Opera Mini way, where they run a proxy to manipulate the
web pages into something smaller. I'm sure Squid could be configured to
help with this (I think the Skyfire browser for Windows Mobile uses
Squid on their server end).

> I, for one, would want SSH and HTTPS. :)

Telnet to a Linux box for SSH. :-)

> do I paste ? Any help?

I'm not sure if it's possible. However, you could paste it into a text
file on the host system (Windows), then read it in via the "H:" drive that
the emulator can make available to you. (A folder on your host system
that the Atari can read from.)

You'll need to convert MS Windows ASCII end-of-line (EOL) sequences into
Atari ATASCII EOL characters. Something you could do in BASIC like:

```
10 OPEN #1,4,0,"H:PROG.TXT":REM THE FILE IN WINDOWS
20 OPEN #2,8,0,"D:PROG.LST":REM DESTINATION ON THE DISK IMAGE IN ATARI DRIVE 1
30 TRAP 100
40 GET #1,N:IF N=10 THEN GOTO 40:REM IGNORE LF
50 IF N=13 THEN N=155:REM CONVERT CR TO ATASCII EOL
60 PUT #2,N
70 GOTO 40
100 CLOSE #1:CLOSE #2
```

Or something... untested, so YMMV ;)

Do all four fire buttons act as the same trigger? Or are they different
buttons? (a la the Atari 7800 ProSticks or whatever they were called,
where there were actually two different fire buttons, which some games used
as different actions; e.g., Jump vs. Fire)

Out of the box, all buttons are button #1. This is done because most
systems use a single button and some could even be damaged if trying
to use additional buttons (unmodified Sega joystick on an Amiga).
However unlike earlier versions, this version uses a 9 wire cable.
Why? For the very reason you mention it is easily modified for systems
that have additional buttons, or building a custom rapid fire switch
etc.

Oh, nice! :) Sadly, not in the market for any new controllers (I'm swimming
in them), but it's definitely nice to see new, nice-looking controllers
made for these old systems!

(Just got a Genesis. Still need an Amiga of some sort.
Oh, that and more free time. ;^))

3365. [Europe] Looking for an Atari 1050 power supply unit

Newsgroup: comp.sys.atari.8bit
Date: 2009-09-01 00:58:52 UTC
From: Davide Guida <davide.guida@gmail.com>
Message-ID: <768606ed-0886-4072-8ee8-7a0b10a94834@n2g2000vba.googlegroups.com>
Source record: 1954

Hi,
I'm looking for a original, working, cheap 220V-240 AC 9V, 3 or 3.4A
power supply unit for my nephew's Atari 1050 disk drive.

I found a shop selling it at a nice price, but it is in the US and
shipping are enough expensive for Europe, also needs an additional
voltage adaptor to buy.

You can write me to the address above or/and to:
davide.guida@formamedia.it

Thanks
Davide Guida

3366. 2009 ACEC Swap Meet

Newsgroup: comp.sys.atari.8bit
Date: 2009-09-01 01:57:28 UTC
From: atari71 <acec71@gmail.com>
Message-ID: <846723be-d314-456b-beae-a25937443b67@d34g2000vbm.googlegroups.com>

The Atari Computer Enthusiasts of Columbus will be hosting the ACEC
2009 Vintage Computer and Video Game Swap meet on Saturday 09-12-09 in
Columbus Ohio. The show will be Free for dealers as well as shoppers.
It will be held at Oakland Park Community Center from 9 am. to 3 pm.
We have a new feature this year that will allow dealers to pick out
what particular tables they want. Please check out our web site at
acec.atari.org for further information and updates.

With colons? Uh... Yeah, pretty much ALL BASICs support that! :)
e.g.:

10 PRINT "HI":PRINT "BYE":GOTO 10

Interesting. If I was ever aware of that, I've forgotten due to all the other programming languages I've used in the 20 years since BASIC.

It does sort of seem to go against the principle that engendered the idea of spacing your line numbers out by at least 10 (ie: so that it's easy to insert additional lines in between other lines.)

Been a while I seem to recall there were conflicting goals. Not that anyone ever wrote anything but spaghetti code with Atari BASIC *BUT* you could save a few bytes by having your code at the line limit of just over 120 characters. Line numbers are stored as integers so you can have up to line number 32k. Each line number takes up an extra 2 bytes I think. Atari BASIC was meant to run in the original 8k system and you only needed 16k to run it with DOS.

Anyway it made for all kinds of gymnastics with people using the abbreviations for commands so they wouldn't exceed line lengths. You would write:
10G.10
and it would expand when you listed it to
10 GOTO 10

Of course this screwed anyone who tried to enter the program from a listing and didn't know all the abbreviations.

There were programs that did things like replaced all your descriptive variables like TOTAL with two letter codes like AC. Dave Small who did the ST accelerator and the original CORVUS hard drive interface wrote at least one 'stuffer' program like that. I think Crawford of Easter Front

and De Re Atari fame did one or two.

```
Combining statements on a single line saves 4 bytes;
2 bytes for the line number and 1 byte each for the
next statement offset and the next line offset IIRC.

The variables are stored as 1 byte tokens in memory
and in SAVEd files, so that shorter names conserve
only a few bytes only one time in the variable name table.

Vintage Computer Festival East - Sept. 12-13

This year's Vintage Computer Festival East will be held September
12-13 at the InfoAge Science Center located in Wall, New Jersey.

VCF is a public event celebrating the history of computers from the
1940s - 1980s. The morning schedule is for lectures and workshops;
the afternoons are an open exhibit hall where everything is turned on
and working.

Among this year's highlights are the keynote address about RCA
computers in the 1950s, an 8-bit musical concert, BASIC programming
challenge, and the build-your-own terminal workshop.

Details are posted athttp://www.vintage.org/2009/east/ where you'll
also find the latest VCF news. A 2-minute video montage of last
year's show is on YouTube at http://www.youtube.com/watch?v=0mNXrKjiD78.
Or refer to the simple event brochure athttp://www.vintage.org/2009/east/vcfe6.pdf
.... tickets are $10 for one day or $15 for both days; 17 and younger
get in free.

The event benefits the InfoAge Science Center, which is a 501c3 non-
profit.

Thank you,
- Evan Koblentz

Did OSS (or whoever bought them) ever release Action! into the public domain? If so, where can I download it and the optional utilities disks?

If not, is it still available for sale?

Were there ever any third party books for action, maybe something like a "Black Book"?

That would be FTE aka Fine Tooned Engineering Mike Holman.

AFAIK of the things FTE took over the only public info we have is from Newell who said deal with their memory upgrades wasn't finished to his satisfaction so he was putting them in the public domain. I'm not sure if he included anything else like Omnimon or Omniview. MyDOS which was closely tied to Newell product became ~free ware before that. You may be able to Google the group and find his post.

There is at least one emulator site that has Action! for download. I'm not sure if there are any complaints since cartridge sales for an emulator would be low.<grin> I don't know if it has the utility disk available but you wouldn't be missing much: The utility disk sucked donkey scrotum. I think I got mine on sale for ~$19 and regretted it ever since.

You may be able to find a cart on eBay but be prepared for sticker shock. Tutorials are nothing to write home about and there never was an instructional book written. A couple of us are pretty good with the language so if you have any specific questions why something doesn't work or how to do something we could probably answer.

Cut and Paste text files? Don't think it will work.

However, Atari800win plus (and Atari800) can directly import ASCII
text files (CR/LF delimited) or linux text file (LF delimited).

e.g.

Use a text editor. Paste your atarimagazine clipping there. Save it
to your_folder (whatever your folder's path is).

In the emulator set H1: to your_folder

In the emulator H6:-H9: mirror H1:-H4: but with end of line conversion

From BASIC if you try

enter "H1:my_prog.txt"

it won't work because the emulator is expecting to pass Atari EOL
delimited text files unfiltered.

To make my above example work you instead type

enter "H6:my_prog.txt"

Hope this helps.

Regards,

Steve Sheppard

Let's see if google groups will let me post since I am on my laptop.

Thanks for the links! Couple were busted but still enough worked to be worthwhile.

I did check eBay and there were only 2 carts available for $130 and $80. I think I only paid ~$70 for mine when it was new!
It makes me wonder if it is collectors or programmers driving the price up. If it was just the language, I think someone wrote Windows cross compiler. Personally I love the editor just about as much as the language.

Adrift because it could be a month or two before I get my 65816 SBC. I decided to give cc65 a look. I still don't have a permanent Atari setup so I fooled around with everything else. I have a small hand held MP4/3 player with an NES emulator so compiled a couple of "hello, world" type programs to get the feel for it. Turns out my hand held has a pretty crappy emulator as it crashes on several program ROMs that the FCE emulator runs fine. Took a bit of doing but it seems to run my code just fine after a few mods. For some reason cc65 for the NES seems to support <conio.h> and not <stdio.h> I guess it is so you don't think there is a mass storage device or printer attached.

There's a couple of things about cc65 like the conio.h that I wish were better documented. I guess it is the nature of the beast in that you can't let anything be the default if you are supporting a dozen systems. Between cc65 and Action! I should be able to do some basic utilities.

In the UK, Maplin sells the L53BR PSU that serves your purpose, you will only need a cheap British standard to Italian plug adaptor.

The History of Star Raiders: Taking Command
by Matt Barton, Bill Loguidice
Sept. 8, 2009

http://www.gamasutra.com/view/feature/4127/the_history_of_star_raiders_.php

Karl Marx once famously wrote that "mankind... inevitably sets itself
only such tasks as it is able to solve, since closer examination will
always show that the problem itself arises only when the material
conditions for its solution are already present or at least in the
course of formation."

Although many of us may disagree with the bulk of Marx's ideology
(or are baffled by such long-winded quotes), here we find a kernel of
truth -- especially when applied to game development.
...

Good to see a good game still getting some love. ;)

I don't get it. Most of the text didn't even talk about the game at all.
It would have been better to reprint the article with an interview of
the game's designer, something I read some years ago.

Or at least a new interview...

"Read this very carefully, I shall type this only once nyo!"
"There would be little point in typing it twice nyo!!" - 'Allo 'Allo nyo

"They make crayONs; do they make crayOFFs?"

Well, I think the main point was to show that all of the fancier games
that came later were (most likely) inspired by Star Raiders.

There seems to be a theme. (I didn't read the other articles it mentioned.)

Siis .. VAUDE!

08.05.2008 j�� historiaan hetken� joka kiistatta osoitti miten maailmanenn�tysvauhtia suorastaan megaromahtanut ydinvoiman kannatus konkretisoi laajassa rintamassa my�s Suomessa. Miten t�llainen saavutus on edes teoriassa mahdolista maassa, jossa ydinvastustaminen rinnastetaan sumeilematta maanpetokselliseksi toimeksi?
No ensinn� tieto ydinvoiman petollisista vaaroista on kiistatta alkanut saavuttaa maamme �lymyst�j� ja asioitten oikeista tiloista kiinostuneita. Kun yritin l�hett�� t�t� tietoa nettiin huomasin, miten RAIVOSSAAN ydinhallintomme tapahtumamuutoksista ydinasioissa oli. Nettini kaadettiin systemaattisesti sen kymmenet kerrat. Kas vaan riehuva SUPO/TVO/IAEA ei selv�sti ollut tyytyv�isi� aamun uutisanteihin!))

No optimistisesti toki oletan", ett� viel� tulee aika jolloin TVO p��st�� taas n�it� materiaalejani eetteriin. .. Kenties olen liian optimisti, kenties en, aika n�ytt��. Mutta kirjoitetaan nyt silti valmiiksi off-puskuriin. Eli jys�rip��ns�ryn takana on YLE:n yll�tt�en julkaisema ydinkannatustutkimus. Kuten hyvin muistamme vain vuosi sitten ydinvoimalla oli maassamme kiinte� huikenteleva +80% kannatus. Ja tosiaan nyt julkaistiin raportti siit� miten maastamme en�� 20% haluaa edes yhden lis�ydinvoimalan, jota TVO/Fortum/Fennovoima himoitsee!!!! .. !!!! ..

Kerrottiin miten n.2/3 osa on ydinvastaisiksi tulleet maasamme. Ydinvoimaa vastustaa naisista 68% joka taustoittuu hienosti taannoisen nuorisoparlamentin Niinist�n mittaamaan 80% ydinvastaisuuden kanssa kauniisti. Ehk� kaikkein huvittavinta on se, ett� ydinyhti�iden triplarakentelu sai maanj�ristystuomion, eli VAIN 4% on samaa mielt�! Ylisanani kehumisiin loppuivat liiasta k�yt�st� asiassa, joten se my�s numeroista. Mutta sitten mielenkiintoisimpaan. Mist� sitten miljoonat ��nens� ydinvastaisuudelle antaneet saivat tietonsa? TV:st�k�, no hei ei tasan! No lehdist�? Onko kukaan koskaan n�hnyt yht��n ydinkriittist� lehden omaa artikkelia ani harvojen sensuurin l�pi p��sseitten yleis�kirjoitususkalikkojen lis�ksi, no hei EI. Radiosta ei yht��n enemp��! MIST� t�m� massojen tieto siten on per�isin oikeesti! Naiset ja nuoret ovat tunnetusti alkaneet l�yt��.. .aivan oikein nettisivuilta maailman ainoaa viel� vaivoin SUPO:n sensorien l�pi livahtelevaa faktaa siit� miten ydinvoima on kylm� kuolema ihmiskunnalle!.. .Toki paljon olisi jatkettavaa t�st�, ett� ketk� ja koska, miten, mutta tosiaan miettik�� miksi vain miehet ydint�iss��n jossa netin k�ytt� on tiukasti kontrollein estetty ovat en�� merkitt�v�mmin ydinharhapoluillaan viel� hetken?.. ..

Story is poignant. Unless you are looking for it, it is often easy to miss the backbone of the story. O'Henry's "The Gift of the Magi" really hits you over the head with it: Woman sells hair to buy watch fob for man and man sells watch to buy woman a comb for hair.

You have to know a lot of trivia that most sane people would deem a bad waste of brain cells. For instance Richard Garriott who by all accounts made millions off the Wing Commander franchise mentioned in the article has used the money to 1) Dive on the Titanic 2) Go into outer space in a Russian space craft. I think he spent something like !$35 million on those two vacations.

Doug Neubauer is relatively unknown<outside of our circle where he still enjoys demigod status!> and still working for a living having never hugely profited from a genre he pretty much created. Specifically a lot of people have bought a lot of groceries with the paychecks they got while working in the industry he created and they don't even send him a birthday card.

But this is just the way things go. Tesla, Philo Farnsworth, et al, outside of a geek circles nobody knows them. I mean even in the popular press Neubauer makes all the top ten lists but it is usually in articles only 'we' read. Tila Tequila on the other hand... Almost enough to make you hold the proles in contempt.<grin>

Heck I see he has a web site up so I will email him a seasons greeting this year.

Rick

3404. ProSystem with only one SIO cable - external PSU?

Newsgroup: comp.sys.atari.8bit
Date: 2009-09-13 10:59:17 UTC
From: Linards Ticmanis <ticmanis@gmx.de>
Message-ID: <4aacd085$0$30233$9b4e6d93@newsspool1.arcor-online.net>
Source record: 1993

Hello all,

I already asked this on the Atarimax Product Forum, but there seems to be very little traffic there... so I'll ask here too. Google didn't turn up anything useful, so please bear with me if this has already been answered.

Ok, how do I use ProSystem with

1.) SIO2PC Serial version (just bought) from Atarimax - version with SIO connector (rather than the terminal block for connecting bare wires)
2.) only one SIO cable available, so no way to power the interface directly from the Atari.

From what I read, I need to feed some external power into the SIO2PC module... but I didn't find an exact explanation of what has to be done. One thing is for sure, I don't want to modify my existing Happy 1050 drive and/or SIO cable.

So....
0.) Any source of SIO cables other than eBay? I guess not...

1.) What voltage do I need?

2.) Where do I feed it into the SIO2PC PCB, possibly without doing any irreversible damage to it?

3.) Do I need to add any more components to the PCB?

4.) Can I use the +5V from a PC Game Port? From the Atari's Joystick Port? From an USB port? Any precautions to take in either case?

5.) If not, what kind (volts/amps/DC or AC) of external PSU do I need, and how do I connect it?

6.) What about the serial DTR line, many devices use that one as well as a power supply (pretty much all serial mice, for one thing). Is that possible with the ProSystem software? How would I modify the SIO2PC in this case?

I'd love to get comprehensive answers, but even if you can only help out with one or two of the questions, please do so. Thanks in advance!

Regards,

I finally started working on the silly little garbage-truck-driving
game I've been wanting to make for my son. (He's been enamoured with
garbage trucks for at least an entire year now, and he's not even 3 yet.)

I just posted some photos to Facebook; here's a link to view them
(you don't need to have a FB account, or be my friend or anything):

http://www.facebook.com/photo.php?pid=3096336&l=edd53da487&id=518895777

It makes a pleasingly obnoxious "beep! beep! beep!" noise when you
drive the truck backwards, and if you hit the fire button, it honks.
I expect my marriage is going to end soon. ;)

I just left a detailed response in the forum on Steve Tucker's site. Please be sure you have the necessary technical skills before attempting the mod?

Hi Steven.

I looked at your response and thought I would add the joystick port isn't really a bad idea: Has 5v at .2 amps available. The poster didn't say what type of computer he is using but all Atari models have the regulated 5V coming out of the joystick. All that would be needed is a jumper wire plugged into say the second joystick port and run to the interface.

I have a number of USB powered devices but I share your caution. I am pretty sure the limit for a USB port is low, like .2 amps, so if he hangs to many cameras, mice, and the Atari on his Intel box it could end up being trouble.

I still have some trouble understanding what the original poster's beef is. I mean specifically he doesn't want to modify anything but he is still going to have to pull the other signals like data I/O and CMD from somewhere right? The SIO2PC module isn't wireless, has to get the signals from somewhere. Easiest way would be getting another SIO cable and cutting it in half.

Rick

Sure, that sounds like it would work. But, I think the goal is to run an
Atari disk drive from a PC without having a computer on the bus.

Even when USB ports on a PC negotiate successfully to provide power, they are
still marginal in many cases. I have a Tascam guitar trainer unit that plugs
into USB for the purpose of downloading MP3 files. Running on my ASUS P5B-DS
motherboard, it would spuriously disconnect itself and/or crash in the middle
of file transfers. By experimentation I discovered that everything worked
fine if I inserted a little wall-powered USB hub between the Tascam and the
computer. So much for standards...

Can't speak for the OP, but in my case I wanted to run a drive directly off my shop PC for the purpose of imaging or creating diskettes and did not want to drag out one of my Atari computers just for the sake of providing power.

Hello Rick,

My "beef" is that I only own one SIO cable and that they seem to be hard to get. I've been told now that some places still sell them. Still, ordering stuff from the US is a bit slow and a bit of a hassle for me since I'm located in Germany.

So my question (in the more abstract) was, how do I read/write real floppies to/from Atari disk images, with the images located on a PC's hard drive, and with my existing hardware. Which is: one 130XE, one 1050 w/ happy board, one SIO cable, one SIO2PC serial. And of course a PC and a serial cable.

I think I will just try the Atari joystick port (or PC gameport) method. Just stick a wire to the port. Seems to be the least hassle.

Thanks to all who answered!!!

Totally off topic, but man that sounds bad, "did not want to drag out one
of my Atari computers..."

It should be on a pedestal! or at its own desk at least. :)

Ah, sorry! My problem is "too many classic computers, not enough time".
There are so many little systems around here in various stages of
configuration and no free surfaces to put Yet Another Machine on.

If someone contacts me for an image of an Atari diskette, I just want to fire
up the shop computer and talk to the 1050 drive directly. If it's a matter of
setting up an 800 to do that, I'll be in three levels of stack overflow before
I ever get to the disk imaging part!

Steve

<snip>

I understand totally Steven, my wife gets that "thunderclouds are rolling
in" look everytime she looks at my various comps and their storage places.

(although her "what-nots", glass figurines, 'n such can go anywhere, in
any number of cabinets, and the less said about them the better). :D

Just yanking your chain. :)

Hmmmm... I'm not quite sure what counts as male and what as female for
the 13-pin SIO. The SIO2PC has a socket with 13 pins in it - just like
the socket you'd find on any Atari computer. The cable that plugs into
it has a plug with 13 holes.

And yes, the DB9 port is female. You can even plug it directly into the
PC if you remove the two screws.

Hrm, you should've seen a whole album.

In any case, it's now officially released! You can grab an ATR disk image
and view a few screenshots here:

http://www.newbreedsoftware.com/gogogarb/

Includes source. (And I even went back and added comments! ;))

I could be off base here because I don't have one of Steve's latest
incarnations of the cable.

I was under the impression he added circuitry to his cable such that it
would be smart. That is, if you plug it between an Atari computer <=> PC
it will know you want it to be and SIO2PC cable. If you plug it between
a 1050/810 disk drive <=> PC it will configure itself as a Prosystem cable.

If the latest design does work as a Prosystem cable it will do what you
want. All you have to do is plug it into a PC and your drive and you can
copy disks from the PC directly to the drive. The interface is powered
from the PC serial port in that mode.

I haven't used the Prosystem software in ~10 years or so but I remember
it had several advantages over using a an 8 bit computer with disk drive
and SIO2PC cable to do make a disk copy. Since the image is written
directly from the PC the system doesn't need for the 8 bit read from the

PC via the SIO2PC cable then write the data to a real Atari drive, very fast. If you have a lot of disks to convert, like a club library, that is the way to go. It also has options for backing up copy protected software and running it from the PC via a SIO2PC cable. I believe Steve has a Happy drive or two and wrote the Prosystem software to perform the same type of functions.

A common way of getting the signals out of a SIO cable w/o destroying it is to just plug wires into the end. Someone suggested paper clips but I find they are too large and bend the contacts.

IF I am right about the latest Ape cable working both ways that is the way I would do it. Takes 1/2 the time to make the disks and can make copies of your existing software on the PC. Of course I like everyone else loves SIO2PC when it is working as a simulated drive but heck, if you have a Happy it isn't necessary.

Just hook it up
Happy >SIO cable >~24 gage copper wires> Ape> 24 gauge copper wires> PC.

Rick

I don't think the issue is so much operational mode, as it is a desire not to have to use an Atari computer on the bus to supply +5V power for the SIO2PC. At least, that's my motivation.

I have never used the Prosystem software, but the free Linux package works just fine in both directions. It emulates a disk drive to the Atari or uses the Atari drive to read and write images.

Well, I'll concede that the 1200's keyboard is arguably the best, and I
have to say that I always liked the XL's looks best as well.

I'd still take one though. :D

Based on his Sales page, it looks like it'll be in the $1000-2000 range
(for parts and labor @ $100/hr).

Though he did publish a book on how to build these things.
(I just found it at his site and added to my Amazon wishlist ;))

Now all you need is time and talent ;-) I'm out. Sigh.

Its fired up my passion for Ballblazer, Koronis Rift and Rescue on
Fractulus tho.

Mark

I finally bought a legit copy of Rescue... one of these days I'm going
to have to figure out how to PLAY it. (Didn't come with a manual.)

I quickly switched over to Star Raider[*] for a bit last night.
My son seemed entertained. Oh, err... by the violence space battle.
Hrm. :^/

[*] Someone gave me a misprinted Star Raiders cart as a gift.
I ended up giving my previous _correctly-named_ one to someone else
as a gift, right after they got their first Atari 8-bit. (This was recenlty.)

I think my misspelled one is the one you see in the photo at Wikipedia,
unless someone's finally replaced it. ;)

Star Raiders is by far the best space shoot em up ever. Next is the
Rouge Squadron Series for Nintendo. Pit Stop, Pole Position.... all good
stuff.

Has to be one of my fav moments in gamedom, in Rescue On Fractulus where
the astronaut turns around and he's an alien - real shocker. :)

Until a few moments ago, the ATR I had on my FTP site was an older one,
which didn't have the latest code and didn't include the program itself! ;)

Sorry for any confusion (and thanks to Jan Krupka for noticing the problem!)

Bill!

I just want to tell you that I like the garbage truck. It looks really cool and I appreciate the impression of depth you have created with multiple layers of things side scrolling at different speeds.

One of my sons was a garbage truck addict when he was four years old.

I remember when he got a toy garbage truck for Christmas. He wanted a side loader (like the one in your Atari program) and I bought a huge toy garbage truck which was a side loader according to the box.

When he opened it, out came a back loaded toy garbage truck. He thought it looked great, but was disappointed.

Three weeks later, the first day at the preschool, the first thing he said when I handed him over to the staff that looks after the kids a preschool was something like:

"Hello, I got a toy garbage truck for Christmas. The problem is it was a back loader, should have been a side loader, but anyway..."

Yeah, I got a nice Bruder (younger kid model, versus their scale model
perfection kind) back-loader for my son. For the first 2 or 3 days,
I was afraid he was going to ask to go to bed with it. :)

Gotta run,

-bill!

3438. Cart Chart

I am new to the Atari scene, so bear with me.
Is there a chart some where that describes the game carts and what
systems it will interchange with?
Will 2600 carts work in an XEGS?

> Will 2600 carts work in an XEGS?

2600 carts work on 2600 and 7800
5200 carts only work on 5200
7800 carts only work on 7800
Most 8-bit computer (e.g., Atari 800) carts work on 400/800/XL/XE/XEGS
XEGS carts work on XL/XE

And of course, Lynx game carts (look like flat cards, usually with a curved edge) only work on the Lynx, and Jaguar carts only work on the Jaguar. ;)
I think the ST/TT/etc. had cartridges, too, but I know nothing about those systems.

Hopefully I got all that right. :)

Thanks Bill,
I was afraid of that. 2600, 5200, and 7800 carts can be found all over
the place, but the ones I need/want, I can't find locally.
The search goes on... But that is what makes this a hobby. :-)

I found this in one of my ATR's: Readme file for BMP2TIP.COM.. I believe
that I got this and several other converters
from http://www.atariage.com/forums/forum/12-atari-8-bit-computers/ this is
not 8 for 15, but it is a bmp converter. This is not a binaries newsgroup
so I can't post the ATR.

RoyE

T I P - C O N V E R T E R :
(short english instructions)

The TIP-Converter (BMP2TIP) will convert any 24-Bit, RLE compressed
Windows .BMP file to .TIP (Gr. 9+11; max. 160x119, 256 colors), if it
is no bigger than 160x119 pixels in size. The width must be 160 pixels,
the height can vary between (min.) 1 and (max.) 119 pixels/lines.
It is possible to convert many pics at once, just use wildcards (? and *)
to do so. When done, copy the .TIP pics to the little Atari and view them
with the TIPviewer from EPI/Allegresse... Have fun !!!

Thanks for the effort Roy but I think I may have to write something
myself. TIP was one of those interlaced modes IIRC and I wanted to be
able to translate picture to a character mode.

Having a bad hair kind of day. Found one of my SIO2PC cables that the
little woman had tossed off the deck in one of her "episodes." It had
been sitting in the elements for about 10 years near as I can figure so
I decided to see if it worked. APE Wizard gave notice it didn't see a
CMD line so I switched it from RI to DSR and still no love. It was one
of my early prototypes using a 74LS00 so I finds me one of my other
oddball constructs: A 14C89 soldered to the copper side of the board for
reasons I forget. It had a 25 pin serial connector<yes, remember back
when clones had one 9 pin and one 25 pin serial port connectors!> I took
the 9 pin off the 74LS00 and soldered it in. Still no love with the same
error.

Kind of frustrating. I had visions of doing an op amp sio2pc cable to
lower loads on the SIO buss but not being able to get either cable

working has humbled me a bit. Even tried a 2nd 130XE with same results.

I think I need to start over from scratch.

Rick

Well brush my teeth and call me smiley. Only took another two hours of screwing around.<sigh>

Of all things, after 8 hours of soldering, plugging, and checking, it turns out it was my Dell laptop serial port. Downloaded the APE trial to my other computer and everything worked just fine on it.

Kind of ruins my plan of using my laptop with my Atari in a quiet little cabin I built on my property but I will just pull out and old Intel box.

I should learn to Google first. ;)

http://g4tv.com/attackoftheshow/attackthis/68526/Creative-Computer-Mods.html

I thought he'd actually be on the show, I didn't think it'd just be someone
yammering on, with a few 2-second clips from the video Ben posted. :)

Plus, it is by no means the first Atari portable, there was that
1500XL (which I forgot about) from 2 years ago:

http://www.flickr.com/photos/19933106@N00/3559260164/
http://www.youtube.com/watch?v=EPRxx2r61iA

Heh, and this fellow also made an external CF card reader
that looks like an old Atari XL device; dubbed it the "1001".

Commodore 64's also got some laptop love:

http://www.youtube.com/watch?v=eAnYFkMe_VA&feature=related

And on and on, and I'm getting way too jealous, sitting here on my clunky
new Dell laptop. :)

PS - We need that helicopter game for the Atari. :)

Steve most likely wrote in a work around to the problem in the APE
software.

3461. Help with DOS A.P.E. & Prosystem

Newsgroup: comp.sys.atari.8bit
Date: 2009-10-05 16:30:30 UTC
From: Hornet
Message-ID: <a97kc5la9or91unvn75qptchiq83jcco8a@4ax.com>
Source record: 1900

I recently purchased an SIO2PC (Serial port version) and can't seem to get anything to work. What I am trying to do specifically is to attach my Atari 1050 to my DOS 6.22 Packard Bell 1750CDT (a 486/DX4 machine) so that I can convert ATRs to real-disk format using the Prosystem software. I currently only have the Prosystem shareware (version 1.18) but I would be happy to register it if I can only see it work once.

I'm pretty sure that my mistake is in the COM port and interrupt setup but I don't have any docs for the ancient DOS machine and I'm not really sure what I should be putting in for those values. Any suggestions?

All help would be much appreciated. Atari software is getting scarce. (The good and valued services of Bravo-Sierra Computers notwithstanding...)

Hornet.

Don't forget B&C Computervisions, BEST Electronics, and ebay (when you're desperate... though I'm not sure I've even bought 8-bit computer stuff via ebay.)

<snip>

If it isn't the latest incarnation of cable it may only work as a SIO2PC
cable and *NOT* in the Prosystem mode.

Do you have a real Atari? If so I would try hooking it up in SIO2PC mode
with the cable, APE as drive 2, and your 1050 as drive 1 to do the copying.

Rick

I do not remember how to configure the Com ports in DOS;
but MSD (MicroSoft Diagnostics) allows you to check which
are active under DOS 6.xx.
Win 3.1 gave you access to set some Com parameters at
Control Panel>Ports.
The standard address and IRQ should usually be:
COM1 $03F8 IRQ4
COM2 $02F8 IRQ3
COM3 $03E8 IRQ4
COM4 $02F8 IRQ3

Agreed. Although I have used eBay quite a bit and have only been
disappointed once or twice. In fact, I bought my current XL setup
completely on eBay and it works great.

Yeah, it's pretty recent and I purchased it straight from AtariMax
where it was advertised as being able to work with the Prosystem
software.

>Do you have a real Atari? If so I would try hooking it up in SIO2PC mode
>with the cable, APE as drive 2, and your 1050 as drive 1 to do the copying.

Good advice and I will try this next. Hope it works.

Thanks.

If I read you right, you're trying to hook your 1050 to the SIO2PC/Ape
cable. That won't work, there's other
adapters to do that, however, if you're trying to make real disks from
ATRs, you can do that with a sector
copier. You'd use the APE software, not the PRO system software in
1.18. Prosystem, as I understand it,
allows you to copy a copy protected disk that is in your 1050. Hmm.
I guess you do hook your 1050
directly to the APE/Pro adapter, but you'd be making PRO images for
use in APE, not making real
floppy disks from ATRs you get from various places. You'd make a PRO
copy of a copy protected disk,
then you could load those disks from the APE/PRO serial cable attached
directly to your Atari.
Sorry if none of this makes much sense. To summarize, I don't know
exactly what you're trying to do.

Shoot, lemme try again. not 'then you could load those disks...'
but
then you could load those PRO images using APE software not the PRO
software.

APE on the PC acts like a floppy drive, you point to ATR or PRO images
that you have on the PC and load from them.

If worse comes to worse, try installing a lightweight Linux distribution like Xubuntu or Damn Small Linux and use Hias's atarixfer program. I've had great success with it.

Also, you are hopefully aware that the SIO2PC requires +5V power to operate and that this typically is supplied by having a running Atari computer on the SIO bus along with the drive and the adapter? That one escaped me the first time I fired mine up to do disk imaging :-). I ended up modifying the adapter for external power, but don't attempt that unless you have electronic bench experience.

Short answer: If the red LED is not illuminated and the green LEDs are not both extinguished at idle then something basic is amiss with your setup.

3472. cc65 version 2.13.0 released

Newsgroup: comp.sys.atari.8bit
Date: 2009-10-06 12:54:35 UTC
From: uz@spamtrap.musoftware.de
Message-ID: <hafembaog1@moppi.musoftware.de>
Source record: 1911
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit,comp.sys.apple2.programmer,comp.sys.oric

I'm proud to announce version 2.13.0 of cc65. cc65 is a complete cross development package for 65(C)02 systems, including a powerful macro assembler, a C compiler, linker, librarian and several other tools.

cc65 has C and runtime library support for many of the old 6502 machines, including

- The following Commodore machines:

VIC20
C16/C116 and Plus/4
C64
C128
CBM 510 (aka P500)
the 600/700 family
newer PET machines (not 2001).

- The Apple][and successors.

- The Atari 8 bit machines.

- GEOS for the C64 and C128.

- The Nintendo Entertainment System (NES).

- The Supervision console.

- The Oric Atmos.

- The Lynx Console.

The libraries are fairly portable, so creating a version for other 6502s shouldn't be too much work.

This version has many improvement over version 2.12. To name a few:

- Support for bit-fields.

- Improved standards compliance. Several missing functions and headers have been added.

- Improved compatibility with ancient K&R sources.

- Additional warnings in case of dubious code.

- The startup code went into the library. This simplifies linker usage. If you have a custom startup file, please check it - there have been conceptual changes.

- Several improvements in the libraries. Functions were changed for
more speed or smaller size.

- "Secondary" linker configurations make it easier to support more than
one setup per target system.

- Improved code generation. The code generated by the compiler is faster
than before, usually without much increase in code size.

Precompiled binaries are available for the most common platforms. On many
other host platforms, the sources compile out of the box, so you'll able to
create your own binaries.

For RedHat Enterprise Linux 5, ready made RPM packages are available. These
packages may also work on other rpm-based Linux systems. Please note that
there are separate RPMs for the compiler proper, the docs, and the target
specific libraries. To develop code for one of the target machines, you need
the compiler RPM package *and* one of the target machine packages. Be sure to
download the documentation package if you're new to cc65.

For windows users, there's a user friendly installer package (the one with the
.exe extension). All subpackages are selectable from within the installer
dialogue. The installer will also setup the necessary environment variables
and start menu entries. It is recommended that Windows users choose this
package instead of the .ZIP files.

Precompiled binaries for DOS, OS/2 and Windows are available in ZIP archives.
As with the RPM packages, you need the package for the development host system
(Windows or whatever) *and* one or more of the target machine packages, plus
optionally the doc package.

All packages are available from the MU software FTP server:

ftp://ftp.musoftware.de/pub/uz/cc65/

More information on cc65 can be found on the cc65 web page at

http://www.cc65.org/

There is also a mailing list for discussing cc65 related issues (programming,
suggestions, bugs, ...). See

http://www.cc65.org/#List

for information on how to subscribe to this list.

While I'm the main developer of cc65, it is actually a joint effort. I would
like to thank the target library developers, all the people on the cc65
mailing list, all those sending suggestions and feedback, and even those
bugging me for a new stable release:-) The CREDITS file is probably
incomplete, but you know who you are.

Thank you!

Uz

```
Some checking.
OK, yes you can write ATRs to real floppy in a 1050 using PRO118.EXE.
It isn't necessary, as you could use
a sector copier and APE118.EXE instead.
```

So I've got Linux (and no Windows or APE), but I've got an SIO2PC adapter.

Is it possible for me to connect my 1050 directly to my PC via the SIO2PC
and use atarixfer to make backups of all of my aging floppies?
(What I had started doing before was 1050->Atari->SIO2PC->PC, but that
didn't seem to be working reliably.)

My main setup these days is an SIO2SD device. (In fact, the PC I've got
here that still has a serial cable is one I'm about to get rid of!)

The thought of having to create dozens or hundreds of blank virtual disks
(ATR files), then mount them one by one and copy floppy disk content to
them through my 800XL or 1200XL seems... tedious.

Being able to just hook the 1050 drive up directly to a PC and then
use the PC's command line to say: "copy what's on the floppy and make
a new ATR file out of it" seems much more appealing.

How do I tell whether I can do this? :)

-bill!

Besides the compiler you might want to update compiler features section
(http://www.cc65.org/#Features) of the website as well ;-)

Nice work!

It depends on your interface. The interface sold by Atarimax is an
autoswitching SIO2PC / 1050-2-PC interface. You just have to supply
+5V if you want to use it in 1050-2-PC mode.

Most other interfaces are either SIO2PC ("atariserver only") or
1050-2-PC ("atarixfer only"). A few interfaces can be switched
from SIO2PC to 1050-2-PC.

Personally I'm using a homebrew SIO2PC and a homebrew 1050-2-PC
interface - and connect the one that I need.

Yes, this is a lot easier.

BTW: I uploaded a new snapshot (090625) a few days ago. The new
version also supports 38kbps transfer modes (XF551 highspeed and
Happy Warp speed) in atarixfer. If you've got a 16C950 card in your
PC you can also use Ultra Speed (Happy, Speedy, ~60kbps) and 1050 Turbo
Speed (~70kbps) with atarixfer and up to 126kbps with atariserver.

so long,

Hias

Just to pick one nit: You also need to install pull-up resistors on three of the incoming signals to use without an Atari on the bus. However, it may be simpler to plug in and power up your Atari and leave it attached while you run atarixfer on the PC. Works just fine, but DO NOT try to access any peripherals from the Atari while the SIO has the bus! That may very well let the magic smoke out of something (figuratively speaking - you won't see anything but it can cause damage).

Steve

3484. Modern Storage Media with Atari ST

Newsgroup: comp.sys.atari.8bit
Date: 2009-10-08 12:23:44 UTC
From: Ely <ely@zapboing.com>
Message-ID: <5b068018-6b4a-43b0-bbb5-4e5a8e1ccf22@l31g2000vbp.googlegroups.com>
Source record: 1923

Hello,

Is there any sort of interface that would allow me to use a CF or SD
card as storage on an ST?

I want to copy off all the files off my 3.5inch floppies but most of
them won't read on my PC (many are formatted for 82Tracks10Sectors).
Just thought this might be an idea to get round the problem.

Cheers
Ely

So my little garbage truck toy/game for my son came out pretty well.
Gave me some confidence. Then I went and tried to write another
new game, and have utterly failed so far. (Not guaging CPU use during DLIs
or something, and causing plenty of fatal lockups and crashes.)

At this point, I have too many ideas and not enough time or skill to
implement them. But some of my game ideas would probably be pretty
trivial for the more skilled programmers out there. (Esp. considering
I don't know assembly, and am trying to shove my ideas into Action!)

So who's up for it? :)

* Ever seen "Quantum", an old Atari arcade vector game with a trakball?
I'd love to see an 8-bit version (heck, it could be in blocky
GRAPHICS 7 mode). And support not just Trakball, but also Touch Tablet
and Koala Pad, and mouse.

* Musical games
- Guitar Hero (though that's best with a guitar controller :)
see Shredz64)
- Taiko Drum Master (surprisingly playable WITHOUT beating a drum,
though that helps, too)
- Dance Dance Revolution (pretty much REQUIRES a pad to jump around on)

Err... and now maybe it's late, and I can't remember all the ideas I've
been brainstorming for the past year. ;)

I don't have the time to contribute but I am trying to get back into
programming a bit after a long layoff so if you want me to take a peek
at your source code I will do it.

I do have an odd pet project I am thinking about that should get me back
up to speed if I ever find the time to work on it.

Years ago I did a rough dungeon/rogue type game that used 3d view
something like dungeons in Ultima III but closer in execution to Dungeon
Master type of step move, five color character set graphics, and had a
few tools for laying out graphics and play fields. Anyway I am going to
see if I can pull anything off the old Tandy 1000 I had the files stored on.

Not that it is a significant epiphany but I think I figured out how to
make it multi user on the 8bit side. Kind of along the lines of the old

bbs door game with a little bit of WoW MMPOG added.

I figure I can have the internet connected computer transfer data encoded in blocks with position in each block being a players move or response.

Let's say 8 bit game server side there are no graphics or screen scrolling to interrupt processing. I should be able to get at least 2400 BAUD through put or the ability to get ~240 characters/second. For a four player game you could update it ~60x/second or a 40 player game 6x/second.

Just had the data encoded by position and tokenized. i.e. 0 => skip or null '1 => cast light '2 cast => magic missle '3 => attack with equipped weapon '4 open door '5 => open chest.
Sequence may come out as strings<for arguments sake>
0100
=> player two casts light
2233
=> players one and two cast magic missile, players three and four swing weapons.

Each player could have small server side buffer for a primitive chat. That is accumulate text until EOL.
00H0
00e0
00l0
00l0
00o0
00<EOL>0
At which time it gets passed to the other players.

Rick

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

Just wondering... Bravo and Sierra are phonetics for B and S.

Why would anyone buy from BS Computers? Sure, it's Ben's initials, but
in the minds of most English speakers, it's an acronym for something
significantly less pleasant.

I've bought from them - no problems at all. Many times, they had items or software that I couldn't find anywhere else. Ben does over-post a bit, but its not that big a deal for me - its what filters or the delete button are for. :)

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

I have bought things from Ben and things went fine. Hey, he may throw
out a lot of ads, but at leas he is there just in case you need
something. Not too many Atari dealers around so let's savor the ones
we have.

I have this game for my Atari 400 computer and loved playing. Now
I use my XE, but this game does not play function well. When you
try and read a scroll, it does not stay on long enough to read.
I hear there is a XE version of the game, but for years I have
not been able to find it. Anyone know where I can get a copy?

>I use my XE, but this game does not play function well.

If it was an older game for the 400/800 maybe you need to pre-load the Translator disk. I'm pretty sure you can get these from Bravo Sierra or B&C...

>Falcon030 with 16meg of ram

Cool!

I myself have an Apple IIe, a Commodore 64, a Commodore Amiga 500, an Atari 800XL and a 486DX-3 75Mhz running DOS 6.22 that I am keeping alive and feeding well, but I would LOVE to get an Atari ST rig but everyone who had a decent one seems to be holding on to 'em...

Ali Baba. I looked in my archives. I have it in .ATR form, and the
one from Holmes says it is
OSB (needs translator, or emulator). (You changed the title of a Ben
Smith thread, which will
get less notice than if you started your own thread, and I missed it
in Google groups, sorry Ed.)
I couldn't find an XL/XE version. If you're using a real Atari, you
could load the Translator B disk first.
I would guess it hasn't been modified to XL/XE OS.

http://www.page6.org/pd_lib/utilities/pd_translator.htm

You'd need a way to get the .ATR over to your XE, like an APE cable.

Or, buy a disk from one of the vendors, Ben Smith, Video 61, B&C, Best
to name a few.

Archive-name: atari-8-bit/welcome
Posting-Frequency: 10 days
Last-modified: June 6, 2009

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari SA of Lyon, France.

Thanks. I did not know there were two versions. Sounds like that is my
problem.

Falcon030 with 16meg of ram

Good point.

And eesh, it looks like "our" web ring got taken over by some kind of
cyber squatter, TheCyberMall.biz? I think I'll just drop the web ring
from the Welcome FAQ, unless someone has a better idea.

3529. Indus GT rom

Newsgroup: comp.sys.atari.8bit
Date: 2009-11-24 17:30:11 UTC
From: Jack Tseng <tseng4@hotmail.com>
Message-ID: <xKUOm.39757$X01.35302@newsfe07.iad>
Source record: 1818

I have Indus GT rom image file rom. How do I put it into the Atari 8bit emulator ? I need it for running DOS XL with synchromesh in the emulator. Like 1541 rom is used in WinVice. Anyone can help?

Thanks!
Jack Tseng

3530. Modified Atari 1050 rom?

Newsgroup: comp.sys.atari.8bit
Date: 2009-11-24 17:35:40 UTC
From: Jack Tseng <tseng4@hotmail.com>
Message-ID: <HPUOm.39758$X01.2178@newsfe07.iad>
Source record: 1819

Can we modify the Atari 1050 rom? I need to format the double density, use 26 sectors per track instead of 18. 90K is increased to 130K. Can 180K be increased to 260K?

Thanks!
Jack Tseng

3531. Re: Modified Atari 1050 rom?

> increased to 260K?

Well, "it can", but the trouble is elsewhere. Double density really
means 256 bytes per sector, not 128 bytes per sector as usual. The
trouble with 128 bytes per sector is that a shorter sector size includes
more overhead to indicate the start of the sector, the sector and track
number and so on, overhead that is not visible otherwise. This
additional overhead reduces the payload that is available, and thus is
the reason why enhanced density provides less capacity than double density.

Now the reason why the 1050 is not capable of double density even though
the disk controller is is simply because the 1050 has only a total of
256 bytes(!) RAM on board. 128 bytes are used for the sector buffer, and
the remaining bytes are used by the CPU to work with. Thus, it is pretty
tough to extend the 1050 to double density without extending the
hardware in one way or another.

So long,
Thomas

Thomas gave a good explanation. There is a home brew 1050 US Doubler
mod where all you do is add a 6810 and burn the USD code into an EPROM.
Problem is now the 6810 is getting pretty hard to find.

Bob Wooley showed some interest in the 1050 since it used the 2793/2797
disk controller chip it should be able to do anything from 3.5" to 8"
floppies.
But then came the XF551 and SIO2PC and after hacking/promoting those
he kind of moved on to more challenging stuff.

Rick

3535. Fwd: XF551 3.5" Upgrade Nightmare

Newsgroup: comp.sys.atari.8bit
Date: 2009-11-30 20:49:17 UTC
From: bill@newbreedsoftware.com
Message-ID: <4b142fcd$0$1675$742ec2ed@news.sonic.net>
Source record: 1824

A fellow wrote the following to me; can anyone lend a hand?

Wondering if you can lend a hand (or at least a few words) and maybe get this to some of those fine folks (especially Bob Woolley) who spoke at the 2009 event.

I have an XF551. I replaced the ROM with a 27C64 burned with the modifications outlined in Bob Woolley's article on the subject. I pried up short ribbon cable and stamped down a longer one. Under magnification, the contacts look solid. I replaced the 5.25" mechanism with the floppy drive from an Atari Mega ST2 (Sony MP-F11W-5DU). A standard power adapter gets power to the floppy drive. Since I am using an SIO2SD to boot from, I used the dips on the XF551 to set the drive to D2:. I am booting the Atari from the SIO2SD into MyDOS 4.53/4.

When I use the "I. Initialize Disk" tool, the drive seems to go through the entire init process (long time rip-rip-rip-rip-rip, eventual BEEP, rip-rip-rip-rip-rip) but then finishes with an Error 144. I have tried this without changing any of the parameters in DOS, changing the density to double ("P. Set Density","2,D"), and high capacity ("O. Change Config", "High Capacity: Y", "Sectors: 2880"). None of these or in any combination change the result, which is a seemingly perfect initialization apart from the final Error 144.

My goal for this is to write images back to floppy. I don't care about the extra space except for perhaps a few file game compilations. I am open to any suggestions, including, "Hey I have an XF551 3.5" that I'll sell you for $XXX.00!" =)

At your service,

Daniel Lee

Thanks!

Apparently he's already in touch with Bob. But if anyone else chimes in
here, I'll pass it along to Daniel, too.

3538. "Tux's Turtle", a modern Delta Drawing

Newsgroup: comp.sys.atari.8bit
Date: 2009-12-01 08:56:32 UTC
From: bill@newbreedsoftware.com
Message-ID: <4b14da40$0$1655$742ec2ed@news.sonic.net>
Source record: 1827

Check out my new pet project:

http://tuxsturtle.sourceforge.net/

It's based on the concept of "Delta Drawing", which I have (had?)
for my Atari 1200XL. It's turtle graphics, but it's even easier
to use than Logo. (It's commanded with single keypresses,
and responds immediately. [Backspace] both undoes the previous
drawing/movement operation that you see on the screen, and removes
the previous command from the program listing.)

The YouTube video I've got embedded on that page should sum
up the capabilities (hopefully). Enjoy!

Posting-Frequency: 10 days
Last-modified: November 16, 2009

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

3548. New Retro Auction Website

Newsgroup: comp.sys.atari.8bit
Date: 2009-12-05 16:29:42 UTC
From: rwap <sexy.rich68@googlemail.com>
Message-ID: <6b6c5166-b4a2-4692-a872-9f8c45f7d54d@p23g2000vbl.googlegroups.com>
Source record: 1837

We have now launched SellMyRetro.com - the intention is to give an alternative to ebay which is cheaper for selling retro electronic items - but will also act as a place for traders, collectors and buyers to come together.

We are currently working on a Wiki element for each category - the text will be editable by store owners.
We also aim to have two types of webstore - a free one so that it can be used to highlight the traders in each category even if they have nothing to sell through the website, but if they do, they will pay normal fees on everything, or a paid for webstore, which costs £5 per month, but they get 50% off all fees.

Feedback is more than welcome - I am sure we will have missed some important categories!

You have definitely missed the important issue of hosting bandwidth. That site cannot get out of its own way. Gave up trying to browse it.

OK thankyou - I have done some speedups on the php code and contacted
the hosting company about bandwidth.

Well the hosting company have done some work on the server and I have
now installed the Zend Optimiser - alas GoDaddy don't seem to be one
of the fastest hosting companies about!

I recommend the Vintage Computer and Gaming Marketplace:

http://marketplace.vintage-computer.com/

It's been around quite a while.

Looks like M.U.L.E. is back!

Planet M.U.L.E. is an economic strategy game for up to four players connected over the internet or your local network. It is based on one of the earliest multiplayer games of all time: Dan Buntens M.U.L.E. by Ozark Softscape.

With the blessings of the Bunten Family, we are proud to present you the first official internet version since the game was released 26 years ago -- and it's free for anyone to play!

http://www.planetmule.com/

I've yet to try it out, but I'm really glad they made a Linux version, since I don't own Windows or a Mac! :)

Well that is a nice little site - it will be interesting to see how
sellmyretro.com develops - it probably helps that as well as hosting
the site, I am developing it to add more features, and listing a lot
of my own items for sale too!

Alas the code for http://marketplace.vintage-computer.com/ is not
adaptable by the site owner and you end up paying through the nose for
more features to be developed.

My own is based on the Enuuk platform - and I have reduced the time to
load the category page by 70%, which will help address the bandwidth
issue - although I think that is more down to the speed of the servers
run by Godaddy....

The Wiki section of sellmyretro.com is now implemented - would someone like to provide some text on Atari 8 bit computers to add to the site? Only those with webstores can edit the text, but I would love to add some info on Atari and their computers.

Cross-posted to: comp.sys.atari.8bit,alt.folklore.computers,alt.religion.kibology

I've just learned that Atari was working on a special low-cost Atari computer to compete with the Vic-20 and Timex-Sinclair 1000. Codenamed "Zelda" and to be released as "The Atari 200", it was supposed to be software-compatible with the Atari 400 at one-third of the price. I wonder why I've never read about it here.

Apparently prototypes were sent out to software companies throughout the southwestern US in 1980 so that they could test and modify their products for compatibility. It had 4KB of RAM, which was more than the Vic-20 had, but less than anything it was supposed to be software-compatible with, but there was an even bigger concern. Its CTIA chip was a cheaper version that couldn't do the high 320-pixel-wide graphics or text modes. The operating system was retooled to center around 20-column text in "Graphics 1" mode, using an underscore cursor and no lowercase or block-drawing characters. This saves hundreds of bytes of RAM and ROM on its own, and they cut even more from the ROM by removing all the support for arrow keys, variable tabs, and other advanced screen editor commands. It still booted to Memo Pad, and BASIC and PILOT were still supposed to work. I don't know what it did for games that used hard-coded display lists; did Pac-Man have blank scores, or merely illegible ones? I got conflicting reports.

It had two joystick ports instead of four, and its keyboard was completely flat with a simple white keyboard design printed on it, matching the Atari 400's except without the unsupported control keys. I'm not sure whether they skipped out on the serial port entirely, as prototypes varied, but it definitely supported a line-in interface for loading cassette programs out of your existing stereo.

But what made it really remarkable was the case. As many of you are aware, the Atari 400 and 800 were designed with an excessive amount of shielding, as they were working under stricter FCC guidelines than when they designed the XL and XE series, and with more protective parts. The Atari 200 couldn't reach its target price with expensive metal shielding, so even though the circuit board itself was tiny, it was surrounded by a several-inches-thick case made of a lightweight polystyrene, treated with some recycled metals, and chemical dyes. This supposedly formed the case, the RF shielding, and the circuit board mountings, in two solid pieces. No fasteners were needed, as the top half screwed into the bottom half like the lid of a jar. Indeed, this was how you plugged anything into the Atari 200, including joysticks and cartridges. This was reported to be less awkward than it sounds, considering

it weighed very little, despite having a footprint the size of an Atari 800, and being twice as tall. However well it may have blocked radio interference, apparently they just couldn't work out a way to channel heat effectively out of that igloo of a case, and the case material reacted badly to the buildup. Indeed, all my Atari 200 research started when I was investigating why so many software companies in Phoenix had fires in 1980.

I've seen two marketing flyers that would have been distributed at CES and to local vendors if it had launched. In the first one, it's depicted in a classroom, and children are lining up to use it and program BASIC. The screen shows large text in three different colors, as if it's in Graphics 1 text mode. It's on a desk that's clearly too durable to have belonged to a public school, next to what I suppose is an Atari 210 disk drive, which would have taken surplus 8-inch floppy disks. In another, it's in a kitchen, next to a 40-column plotter and no monitor(!), and a man with an apron and a necktie has one hand on the keyboard and another hand on a frying pan, while cradling a telephone under his chin. According to the ad copy, this was apparently a campaign to have an Atari device in every room of the house, but I don't know who has room in their kitchen for an Atari 200. It would be neat to make a fondue pot out of it, I guess.

I've seen only one prototype photo, a Polaroid taken for an insurance claim. It shows the bottom half of the case, containing a circuit board, ports, and grooves to guide joystick cables and such out of the case, and a giant crack that's definitely not part of the design. I'm no engineer, so all I can say about the internals is that I didn't see a serial port in there, but I did see a section of ribbon cable that looked like it would have connected to the keyboard. It looks like it's been burnt or melted or something at the halfway point.

The person who showed me the prototype photo was going to scan it so that I could get the chips identified, maybe even get MESS drivers written for it. But he hasn't answered his phone or his door in weeks, which is too bad, because I need to return his Atari 1600 prototype, as I'm low on money and space and need to rent out the two bedrooms I'm keeping it in.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Nobody did, which is likely one reason it never made it to production.

But it's decades later, and some people are apparently interested in prototypes, those home computers that never were. Back then, the magazine articles would feature them, and then you'd never hear anything more about them. Lots of speculation, but somehow they never appeared. Now, they become sought after items because collectors have collected all the common stuff, and having some prototype in your collection makes your collection different from all the rest.

Michael

Not "Microsoft's short-lived Unix"; it was Microsoft Xenix (but I
have no idea if that's what it ran).

In reality, it ran Xenix. That's the way Mi$uck spells "Unix".

According to what I read on the interwebs, it did run Xenix on the
68000. However, in practice, ours ran TRS-DOS on the Z80.

This is a good read if you'd rather find out about 'Xenix',
instead of listening to Microsoft haters, not that I like
them all that much myself. 8^)

http://en.wikipedia.org/wiki/Xenix

ISTM that Xenix was in reality developed by SCO (the Santa Cruiz
Operation), a company that Mi$uck had about a 30% investment in at
one time. I think Mi$uck may still use their ownership in SCO to
sue over the use of Linux.

I didn't look at the link, so I didn't know what computer it was, and
I only guess now.

There was a TRS-DOS for the Radio Shack 68000 based computers. I can't
remember if that was a stop-gap until Xenix was ready for it, or if
there was some other reasoning.

Not only that, but it only SEEMS to him, and he only THINKS that
what he says might be. He provides NO references to what he speaks.

Also, I find that folks who use Microsoft $ucks to refer to them,
are usually just jealous and couldn't write a program to print
"HELLO WORLD" if their lives depended on it. LOL

You did when it was the 16-bit version.

There was a version of TRS-DOS that ran on the 68000. I can't remember if
it was the plan all along, or if they had to scramble because Xenix was
late.

Actually, I was _assuming_ it ran on the Z80. I'm not sure.

I remember SuperCalc and Adventure, and some sort of BASIC and ELIZA
and a word processor. And there was a version of CP/M, but I never did
anything with it; I'm not sure if we had any apps.

3583. Hacking the Atari 1050 as a CP/M drive

Newsgroup: comp.sys.atari.8bit
Date: 2009-12-16 08:44:22 UTC
From: Tarkin <tarkin000@gmail.com>
Message-ID: <1deda73d-473f-4373-8b7c-3cae597be025@p30g2000vbt.googlegroups.com>
Source record: 1772
Cross-posted to: comp.os.cpm,comp.sys.atari.8bit

Hello all,
I have been having fun clowning around with my homebrew Z80 SBC (1),
and am at a point
where I can start considering storage options.

Quick specs:
Zilog Z80B @ 6 MHz
2 x 32 KB SRAM (full 64 KB contiguous available after h/w init)
512 KB FLASH EEPROM - 32 KB mapped to 0000 - 8000h at boot
Zilog Z85C30 SCC - uses system clock for BRG ; 8N1 @ 19.2 Kb/s

I've poked through the archives a (very little) bit for info on (E/EP)
ROM filesystems,
found some stuff by Allison, Falconer, and others. The bag-and-tag
(NS*DOS-alike)
method seems like a good candidate, but then I got to thinking....

I have an Atari 1050 drive sitting idle. It uses a TTL-level serial
packet
protocol, TOTALLY h/w compatible with the SCC (just use CTS or DTR
for /COMMAND).
It offers 130 KB of storage, 260 if I make a 'flippy'.

So...I have some questions:

Has something like this been done before? I have read a little on the
1060,
which was an Atari prototype peripheral that was analogous to the
Apple II CP/M
'Z-80 Softcard' (2) ; I also know of (but haven't absorbed the
details) the Indus GT
having CP/M capability through it's own Z80. But has anyone ever (mis)
used
the 1050 drive, sans Atari computer, with CP/M ???

How can I bootstrap a CP/M system? (This applies to the FLASH disk as
well...)
Reading through DRI docs, ISTM there is a stage where you couple your
CBIOS
with an existing FDOS, and then write the resultant FDOS to a floppy,
and then
that floppy becomes your system 'master' for the target. How does one
bootstrap
CP/M for a 'totally alien' disk format- whether FLASH or something
like the 1050?

And are there any rigorous, hadn-holding treatments of CP/M
bootstrapping, DRI
docs aside (I have a Kaypro II manual that is just all of the DRI
stuff inside-
User Guide, System Regeneration Guide, ED/ASM/DDT Guides)
Would a C128 w/ Juggl'er or Apple][+ Softcard help?

P.S.:
(1) In poking through past posts, I came upon a bit by Glenn
Herrmannsfledt
about his homebrew SBC - mine turned out an awful lot like what he
describes!!
(2) I actually have a Taiwanese Softcard clone, which works with my
Laser 128!

Thoughts and comments, please!!

Thanks,
Tarkin

Well, he did say it was a prototype.

Hence, it could have been on wire-wrapped circuit boards. And it could
just be in two pieces with a lot of other computer junk cluttering
both bedrooms.

First some facts: my first computer was an 800XL + 1050.
then some "links" for those not quite sure what it is:
search Google, or whatever, for keywords like:
"SIO2PC" or "sioinstr.txt"
to get a list of pages there points to Nick Kennedy's page...
(for a discussion of the other way around)

This come direct from memory so i could be wrong in more than
one place:
As i remember the Atari protocol was at 2400 baud so it will not
be that very fast. There was some kind of copy-protection in
the 1050's ROM not allowing You to "see" the complete FS,
remember i did buy an "Disk-Doubler", as fare as i can tell it is
a sandwich of 2x6810's + an 2732, with that one was able to

run an disk-editor on the FS, (data on an PC-floppy was inverse).
(and the 1050 don't care about the index-hole)

So from that I'm not even sure this will work with an unmodified 1050...?

Here I'm sure You will get something much better, but my 2cent:

In Boot-Prom make an Start-Menu,
Read 128 byte from Boot-device at track 0, sector 1, place it at
0000h...00080h, transfer control to that, (Jp 0 or RST 0),
those 128 byte should load from track 0, sector 2... track x, sector x the
OS or an extended Boot-loader to load the OS and put it at the right
place in memory,... transfer control to Init in the Bios,
and You are up-and-running...

Good luck...!
<ole>

CPM was designed around 128 byte/sector 8" floppies, other sector sizes
required buffering up multiple logical (128 byte) sectors to write a
single physical sector. The 128 byte sector should not present a problem
to CPM.

No, it's not that bad. The Atari drivers were pretty fast at their time,
the transfer speed is 19200 baud.

> There was some kind of copy-protection in
> the 1050's ROM not allowing You to "see" the complete FS,

You do see the complete data bytes, it's not a copy protection, but
rather an abstraction around the disk transfer protocol. You just send
the 1050 the sector you want to read, and get the data back. Not more,
i.e. you cannot see implementation details like sector headers. Thus,
you do have full access to the payload data, all what is needed to put
data on the disk whatever you like. Sector headers etc. are not "file
system" specific, but hardware specific - and not required to store data
or a filing system on the disk.

> remember i did buy an "Disk-Doubler", as fare as i can tell it is
> a sandwich of 2x6810's + an 2732, with that one was able to
> run an disk-editor on the FS, (data on an PC-floppy was inverse).

You can then edit details like the track layout etc, but that is
typically not required unless you want to copy copy-protected disks that
played tricks with those.

> So from that I'm not even sure this will work with an unmodified 1050...?

Why not? Of course, you would need to tell CP/M *how* to access the
drive; it is a custom, Atari specific protocol with a rather small
sector size of 128 bytes (typical sizes would be rather 512 bytes). I'm
not a CP/M expert, thus I cannot tell whether *that* is possible, but
fitting the 1050 hardware wise to the system shouldn't be a problem.

So long,
Thomas

Hi,

I am not 100% sure, but many others took an CBM (Commodore) drive,
because it's like using a high level language (you have not to use
exotic command sequences and you do not have to consider timing etc.
with the commodore floppy drives, because they have an own intelligence.

Example: http://8bit.yarek.pl/interface/zx81.zx1541/index.html

A 1541 drive was used with a ZX81, and for me it seems to be a feasable,
almost easy approach.

Regards
Peter

I used to sell the Atari 400 and 800. The problem with the 400 was the
keyboard, but it was $200 cheaper than the 800. I can't imagine a
cheaper version of the 400. I bet that is why it didn't sell.

The 400's keyboard was bad. Nearly as bad as the original Commodore
PET (sold them too!).

Did that work out? Seems to me that Linix is growing and SCO is
shrinking if it still does anything at all.

Eric

Gods, the Little Black Brick. It was my first computer. I built one
with three different keyboards that could be used simultaneously
because I didn't like having to shift-etc. to get the graphics
characters. I wish I still had the thing; it was scary to look at.

Nicko, old, boy, when you wrote "here", which of the three froups
you xposted to did you mean?

Or were you just not picky that day?

> ...Indeed, all my Atari
> 200 research started when I was investigating why so many software
> companies in Phoenix had fires in 1980.

As a matter of curiosity, would you happen to know if many of them
were located on/near the then-really-low-rent stretch of Fillmore
Street between 7th Street and 7th Avenue?

I often wondered if the "Fillmore Firebug" had more to do with
accidental fires than, um, sub rosa urban renewal.

Well no. The Atari being described never made it to market, it was a
prototype. Commodore had all kinds of computers that would get press
in "Compute!" and then never be heard from again.

The Apple III may have been a lousy product (or perhaps a lousy
implementation of a "better" Apple II) but it actually made it
into production and had some level of penetration into the marketplace.

I had an Apple III for a while, well after it came out, and it just
fell into my lap with some other junk. They weren't common, but they
weren't rare at the time.

3597. Proprietary Atari chips being reconstructed

Newsgroup: comp.sys.atari.8bit
Date: 2009-12-17 07:41:23 UTC
From: bill@newbreedsoftware.com
Message-ID: <4b29e0a3$0$1590$742ec2ed@news.sonic.net>
Source record: 1786

I saw some hints of this on Facebook, and just noticed this
article at the top of the front page of AtariAge
(http://www.atariage.com/), which also links to their
forum section, where the topic is being discussed:
http://www.atariage.com/forums/topic/154479-new-gtia-chips/

"Atari Chips Reborn"
December 14, 2009

Curt Vendel of the Atari History Museum and Legacy Engineering has
been hard at work reconstructing several proprietary Atari chips,
including the GTIA (used in the Atari 8-bit computers and 5200), the
MARIA (used in the Atari 7800), and the TIA (from the Atari
2600). There is great potential for creating new Atari machines in a
variety of form factors, based on Curt's work. When asked about these
new developments, Curt had the following to say:

"Many in the Atari community, myself included, have cobbled together
one thing or another to keep our systems alive. A dream for everyone
has always been the possibility of perhaps a new Atari 8-bit
system. As many know, I have most of what was Atari's mainframe
archives, among them are what are called "Tape Outs"--these are 9
track reel to reel tapes that in the 1980s and early 1990s would be
sent from a chip design firm--such as Atari's "ASG" (Atari
Semiconductor Group) to a place called a "FAB" which is a chip
fabricator. The final layered data files are in a streaming binary
format called "GDS" and this data instructs the FAB on how to process
and create actual IC chips.

I've been spending a great deal of time as of late recovering the data
from the tapes, having to massage them to process and create a viable
GDS and/or DB file so that the actual chips could be plotted and
tested with some software that I use. The effort has been successful
for the most part and several of Atari's proprietary chips are coming
back to life in simulation. Now we need to see if they can be
recreated in a FAB at a reasonable cost. What is the potential of
this? Doing the chips in smaller SMT packaging, and potentially
bringing back to life some of the later CMOS designs of combo chips
which could lead to a SoC - System on a Chip. This is all very early
work, but the future just got a little brighter in terms of preserving
and continuing the legacy of Atari's custom IC chips."

You can read all about Curt's hard work over in our Atari 8-bit
Computers Forum. In addition to technical discussion (which includes
Curt Vendel), you'll find various high-resolution images of the
reconstructed chips.

Enjoy!

3598. VBXE - "Video Board XE"

Newsgroup: comp.sys.atari.8bit
Date: 2009-12-17 08:05:20 UTC
From: bill@newbreedsoftware.com
Message-ID: <4b29e640$0$1625$742ec2ed@news.sonic.net>
Source record: 1787

While reading about the resurrection of Atari chips by
Curt Vendel & friends, I discovered this, which I'm fairly sure
I had never heard of!

Video Board XE (VBXE)
Programmable, FPGA based graphics subsystem for Atari XE computers.
http://vbxe.atari8.info/

The project is, in fact, a few years old! (Website says "2005-2007")

More at AtariAge (in English):

http://www.atariage.com/forums/topic/152939-show-your-vbxe-installs/

http://www.atariage.com/forums/topic/153863-vbxe-programming-examples-programming-queries/

http://www.atariage.com/forums/topic/154085-mac-65-for-vbxe/

http://www.atariage.com/forums/topic/142283-vbxe-2/

YouTube has some videos of the thing in action. (Search for "VBXE")

Man, I seriously wish AtariAge's forums showed the date that posts were
made. (For every single frickin' post, it shows the date the user signed up,
which is pretty uninteresting. Knowing when the post was MADE makes way more
sense.)

This is why I've stuck to Usenet-only, for the most part.
But apparently I'm missing out, since I'm not learning about stuff like
VBXE until ~2-4 years after the fact. :)

3599. "The Last Word"

Newsgroup: comp.sys.atari.8bit
Date: 2009-12-17 08:10:14 UTC
From: bill@newbreedsoftware.com
Message-ID: <4b29e766$0$1625$742ec2ed@news.sonic.net>
Source record: 1788

Man, I keep finding gems this evening!

Someone's screenshot of their VBXE -- see my other post -- was of an
80 column word processor for the Atari that I had never heard of, which
started in 1999 and was most recently released this year (2009).

http://www.atari8.co.uk/lastword/lastword.htm

"The Last Word is one of the most feature-rich word processors ever
written for the Atari 8-bit. It includes many of the innovative tools
found in programs like TextPro and The 1st XLent Word Processor, and
version 3 of the program sees the introduction of a software driven 80
column display. LW 3.1 supercedes the previously released 3.0, which
should be abandoned in favour of the new version.

The Last Word 3.1 offers:
* Dual 80 and 40 column displays, switchable at any time
* Up to 240 column editing in a horizontally scrolling window
* Editing of up 10 files simultaneously on a expanded memory machines
* Sophisticated keyboard macro language
* 80 column print preview
* Feature-packed file management menu with up to 80 filenames in a
scrolling window and support for SpartaDOS X directories with
time/date stamps
* High speed editing, even at the top of large files
* Support for SpartaDOS X, MyDOS, DOS 2.5 and many DOS 2 derivatives
* International characters and customisable printer drivers
* Comprehensive 75 page manual
* Large collection of macros, printer drivers and help files

More interestingly to me, as a programmer, was some text from a
document that was shown in the aforementioned screenshot.
It was about the design of The Last Word, and how the text is
managed in memory so that the thing responds quickly, even
with a lot of text.

Man, I've got to try this out! :)

Yep, Bill you must join www.atariage.com.

I use the rss feeds for the different forums.

They really have some good discussions on various topics.

Beetle the guy that built the laptop atari 8 bit is also on the subscriber list

Other news you may have missed is Curt Vendel is hopefully making a
pizza box lid for the atari 1200xl. hard to describe but search for
"1200XL Pizza Box".

> CP/M for a 'totally alien' disk format- whether FLASH or something like the 1050?

I modify Dunfield's monitor and put it in ROM on my board. I assemble my
CP/M code under SIMH using SLR Z80ASM or the original CP/M assembler.
Then I load the hex files for BDOS/CCP/CBIOS using the monitor and jump
to the CBIOS start address.

It helps at this stage if you have a disk that's already formatted and
filled with E5h (I used IDE drives) as I then transfer (one at a time)
PIP, LOAD etc. using the monitor, and once in CP/M SAVE them to disk.
Writing a simple XMODEM program will also be useful.

If you can connect your disk system to the PC for formatting and
writing, you can construct the filesystem on the PC and write it as an
image. This is what I did with my Z180 SBC which uses flash ROM and NVRAM.

That's a different SCO. It's Caldera that rebadged itself after
acquiring the original SCO's server software and stuff -- the original
SCO continued as Tarentella and eventually sold itself to Sun.

NO, thank goodness it did *not* work out. ISTR that Mi$uck was
upset because IBM was offering Linux on IBM's "blade servers". The
lawsuit was Mi$uck's way of slowing that down...

Hi,

I'm Jonathan Halliday, the author of "The Last Word", and I was delighted to receive an email from Bill explaining the flukey series of events which led him to discover the program. That was my screenshot (a photo of my set-up at home; a VBXE equipped Atari 8). Anyway, I'm really thrilled to find that the Atari newsgroup is still going strong and I hope to be a regular visitor and contributor here. From the topic index, it looks as if there's some good stuff going on.

By the way: if you head over to atari8.co.uk and download the latest version of the program, you'll find the text document you're talking about on the distribution disk.

Regards

Jon Halliday

The Lisa made it to market. For a price they would convert it to an
upscale (at the time) Mac. For a while, Lisa was the development system
for Mac. Until the sex change.

That seems like the most backwards thing to do. The 1200XL has the best keyboard of any Atari... why would you want to cover it up and replace it with an external one!?!?

I also think, despite how _huge_ it is, that the 1200XL is one of the nicest looking form-factors of all the 8-bits. (And it never occured to me how much nicer side-loading carts are, which is I guess why Curt's doing this to the 1200XL, and not any other 8-bit.)

I need to dig up a treasure chest and have Ben Heckendorn construct a 1200XL laptop for me, with the original keyboard.

I realized I was wrong when I mentioned (in a flaberghasted Facebook
status at 2am last night?) that The Last Word was under development for
10 years. I guess it was "hibernating" for the majority of that. ;)

I spent a little time this mornign skimming the user manual PDF that
comes with the ZIP. You said that that doc was generated in TLW itself?
(aka, "you ate your own dogfood") If so, that's awesome! :)

I noticed a _few_ glitches here and there (font switch for a word or
two, as well as missing inverse characters in some places;
e.g., " ord haracter ine", or somesuch).

I fired it up for all of 30 secs in Atari800 on my Linux laptop.
Sadly, Ctrl+Shift combos don't seem to work for me. But that's
fine, I've got little reason to run an Atari 8-bit word processor,
let alone on an emulator.

However (much as I find my own "Tux Paint" is useful for me when I want
to be artistic, since it's such an up-front UI and somewhat limiting
environment), I started thinking "man, I wish I had something to write".

I've had rare occasion to use a word processor that isn't one of these
modern abominations, like MS Word or OpenOffice. The ones where
writers are SO easily tricked into doing some of the absolute worst
formatting (e.g., hitting [Enter] 20 times to force a page break).
And I'm not brainy enough to want to use LaTeX for anything. ;)

PS - My day job is, in fact, helping authors publish their works as ebooks,
where page-based formatting HAS to be avoided, since screens all differ
and text and reflow, even on the same device (change font/size and/or
screen orientation on the fly!).

> Sent from my computer

I kind of assume the reason we didn't hear much about it is because on
several levels it is a non event. Spectacular on a hacking and
technical competance level of course.

Looks like it is slaved to several things Atari and 6502. Saw where
one person said the picture he was displaying was 152k. I can forget
that a stock disk drive will not be able to store that much data what
with sio2pc and all but you still have to move that stuff around.
Let's say you have 1 meg of ram you can load with 6 pictures. I make

it at ~6 seconds to copy a move a picture to screen ram. Those digital picture frames do a much better job then that. There is also the first load of data problem, 152k at ~19kBAUD sio speed 80 seconds load time per picture. I guess the blitter operation within the CPLD will handle it after you get the data there but it will take a while to do the initial loads.

There's little technical problems I wonder about. He could be using color registers but if not, 3 RGB does not goesinta 8 evenly. You have to do some compromising like 3 red bits, 3 green bits, and 2 blue bits to feed your DAC. Its still light years ahead of a stock Atari but IMHO it would be better with 8 bit bitplanes.

But heck, tried to revive my Tandy 1000TX that had all my source files on hard drive and my Needham PB-10 programmer. I'm kind of a pathetic case: After I finally got the 20 meg MFM hard drive to spin up, it started dripping water from some where internal. Strangely enough, 20 years submerged in a wet basement and the Tandy itself burst to life on first try. I'll have to clean out the mouse poop and termite droppings!

That SBC I was buying http://sbc.rictor.org/sbc31/info.html well, the guy who was selling it to me got swine flu and it pretty much KO'd him from what he emailed me.

All is not lost just yet. I still have a Syquest 130 meg removable scuzzy that looks dry and may still have a copy of my programmer software. Talk about Rip Van Winkle, turns out they went out of business in 2005. Then I realized I probably haven't used my EPROM burner in 15-20 years!

There's one more link you should follow if you want to see a beautiful hack
http://laughtonelectronics.com/arcana/BrideOfSonPg1.html
Wade through that if you dare! I don't think it would work in an Atari because of ANTIC and 6502C but we can dream. What he did was intercepts the instruction byte when it loads on the data buss and replaces it with his own microcode in an EPROM. He implements linear addressing in a 65C02 for 4 megs and the instructions to get there and back.

Rick

Thanks for all the input!

I have hit a snag using the 1050.
The data line (OUT) from the peripheral (what would be IN for an A800)
is stuck logic high, which leads me to believe either it's DIL
transistor
pack was blown from a cabling mishap, or there is some other h/w
failure in the 1050. So, I'm going to set aside the 1050 until I can
devote my full attention to debugging it...

The suggestions RE bootstrapping CP/M all line up with what I have
read so far - Get a monitor working, get comms working (XMODEM,
IHEX loader, etc) and develop the CBIOS and system image on another
machine/emulator.

Also, Peter- I had thought about using a CBM drive- a 1571-
but it looks like it must have a separate CLK line, where as the
Atari drives did not (I think).

Thanks again,
Tarkin

That's one way for a computer company to go out of business. Set fires at all the companies that develop third-party software for your platform. Way to go, Atari!

I think this just about sets a record in an industry known for the terribly mistaken decisions made by various companies at one time or another.

Yes, and it looked and felt like a real computer! It even had a nice keyboard.

But it was pretty expensive, and it wasn't so popular as to have lots of software written even for its principal operating system. So it died pretty quickly when the IBM PC came out.

I keep looking for a way to give the desktop PC that "real computer" feel.

That's correct, it has bidirectional data and clock lines, a pull down attention request line, an attention line from the computer side, ground and reset - six pins. The 1571 is the better choice than the 1541 since the 1571 supports a much faster version of the protocol - when the 1540 was produced for the Vic-20, it had a hardware serial protocol, and they thought they could use the same one for the C64, but they hit a hardware snag (the CIA chip? the main processor / video display processor phasing? some interaction? I forget), and so had to bit-bang it. And of course, the efficiency of the protocol was because it was in hardware - bit banged it was as slow as watching a glacier melt before global warming.

The advantage, as noted, of the 1541/1571 family for this is that you can check that you have the protocol working before trying to put it to use, by writing a small program to talk to the drive and see the response.

The 1571 also has more capable built-in support, since the C128 came with a CP/M built in, and while they should have run the Z80 off the dot clock at 8MHz and used wait states to interface with the C128 memory bus, file-based operations at least were a lot more nimble in C128-CP/M+ than in the old C-64.

For the 1541/1571 serial bus computer side pin-outs, view this in a monospace font (eg copy and paste into a console text editor or Wordpad with Courier). Its one of those DIN plugs that CBM loved so much.

```
Serial I/O
++ ++
+-------+----------------------+ / +-+ \
| Pin | Type | /5 1\
+-------+----------------------+ + O O +
| 1 | /SERIAL SRQ IN | | 6 |
| 2 | GND | | O |

This was the first I personally owned, used a TV as its screen.

The formatting problems are Word 2007's fault: I thought I'd caught
them all, but obviously not. Too bad that thirty seconds using The
Last Word has flattened your enthusiasm completely! ;) If your
emulator set-up can cope with CTRL+L, you can load up DESIGN.TXT and
read all about the programming concepts that appeared to interest you.

I read somewhere recently an article about the perceived advantages of
separating text composition from text layout. I do believe that the

appearance of the document gets in the way of creative flow in the likes of MS Word: hence programs like Q10 on the PC. My writerly output when using an Atari 8 back in the nineties was greater to a ratio of 10:1 compared to my literary output on the PC. There may be other factors contributing to this, like not being at college any more. :)

The original manual for LW was written using LW 1.0 back in 1999 (For information, BTW, the software initially took six months to write. Ten years later, the 80 column version took another six months' worth of evenings and weekends to write, test, and debug) and then ported over to the PC this year for sheer convenience. The source code for the software was compiled "in situ" (on an emulator) using my own MA65 assembler until June this year, when I upped sticks and moved to a cross-assembler.

Did you connect the 1050 to an Atari computer or to your SBC?

If you connected it to the SBC, be sure to provide +5V on the
+5V/Ready input of the drive (SIO pin 10), otherwise the drive
will just sit there quietly.

so long,

Hias

Oh, only in terms of using it in an emulator. And as much as I love
and promote Atari800, I still prefer the real thing for real uses.
(I'll crack something open in an emulator to get the gist,
but if I really want to enjoy a game or demo, or do some coding,
I do it on my 800XL or my (new-to-me!) 1200XL.)

Thanks for the tip!! I had thought the drive output electronics
had gone bad, so I disconnected my second serial port
interface on the SBC, and ripped out the Atario SIO
protocol test code. Luckily, I backed it up....

I will restore the setup, attach the (READY) line, and report back!

Thank you!!,
Tarkin

There was an invention made some years ago that was called the "hard disk drive" and stores much more data - several modern computers are equipped with one. On the A8, MyDOS can handle 16MB partitions and SpartaDOS can handle 32MB partitions. As this is not much by todays standards, usually the hard disk drive is replaced by a SD card or USB stick in a SIO2SD or SIO2USB interface.

> There is also the first
> load of data problem, 152k at ~19kBAUD sio speed

SIO is not restricted to 19000 bps, it is around 4 times as fast on a stock A8 (as you can experience with a Speedy, Turbo or Happy equipped drive) and up to 126000 bps with a modified OS. Additionally, PBI hard disk interfaces were available (e.g. the MIO) and there are currently projects to make them available again.

Since you are so know so much more then me about computers and the
Atari, how about telling me who came up with the 1489 version of the
sio2pc interface and the original Ape Pro cable?

Just and aside, after about twenty years I am really starting to grow
tired of some of the crap you get on the internet. I mean twenty years
ago you got sophmoric crap but it was usually from someone who was
intelligent and sociable enough to at least attend college so as to
have a certain level of knowledge and access to the college news feed.
My point being you could have a difference of opinions and still have
an intelligent argument.

Take Thorsten as an example. Right in my post I start off with

> > that a stock disk drive will not be able to store that much data

This would indicate that I am aware there are both stock and modified
storage devices otherwise I would would not have specifically put the

qualifier 'stock' in my statement.

Now dear Thorsten, from there you seem to draw several false conclusions, proceed to set up a straw man argument, and into hominem insults. Specifically anyone reading my post in context can tell I am trying to convey the fact the modification will not be of great benefit to people with unmodified systems. You then proceed to lecture me about modified systems. The point of modifications being available is not in contention or made in my post. Quite the opposite, I would expect someone without knowledge may follow up my post with a question like "what non stock storage options are available?"

The point I *do* infer and what is perhaps in question is the relative number of people with modified systems. I don't have all the numbers for the number people with modified OS, storage, and technical ability to handle such modifications but experience tells me they are in the minority. I have seen sales estimates of Atari computers from several sources, estimates of the number of people who actually program on the Atari, sales of OSS programming languages, and sales of sio2pc cables.

There is a sliding level of participation where ~95% of the people who have ever owned an Atari have neither learned to program or modified it. It makes me skeptical that this modification will benefit the Atari community at large. The numbers are all wrong. In general your position seems to assume that an otherwise normal person can be convinced to pass pictures from their ~1024x768 32 bit color display Intel box to view in glorious 256 color mode. I can hear my S.O. asking "Why would anyone do that?" and she couldn't see normal with a pair of binoculars from where she lives.<sic>

Well I believe the modification can function as storage too which adds some value. I don't think there is a commercial memory expansion available now.

Problem is history can be a cruel mistress. If you look at the early 80 column boards/carts like Bit3 and Ace<???> they are extremely rare having never sold well. Ditto for that 80 column joystick thingie that Atari made, XEP80.

We have had some really cute video mods in the past. Double check me because my memory may not quite be what it used to be but Michael StClair<sp?> developed a gen lock for the Atari, I happened to go to the SLCC meeting where he presented the project. Bob Wooley did at least two: One was an 80 column 6545 using its own memory and the other was a dual ANTIC<GTIA?> that effectively ~doubled the amount of memory that could be displayed with the resulting increase in colors and lum levels. You could do something like a 16 lum mode overlaping a 16 color mode.

These were both great hacks but I doubt if 10 people were able to get them installed. The problem is not the hacks, it is a combination of user base and the Atari's original design. Heck, I was on CI$ when Dataque was trying to sell their 65816 and you were around when FTE was trying to do the same. Just not a lot of interest or participation from the users as soon as you say "$69 and you have to take your computer apart." WDC tried to make a go of it with the 65802 as an upgrade path for 6502 based computers and they ended up abandoning the thing. It isn't just us, seems to happen in just about every consumer orientated computer from the Apple to the Oric. If you came up with a

hack that saves people a $1,000/year on their utilities and gets them laid, you would still have trouble selling it around here!<grin>

As much as I hate to admit it, Mihocka was right about emulators being the future for the masses. Just saw my son's Google phone and it has a C64 emulator on it. I have a NES emulator on my MP3 player. There's probably more 8 bit systems set up as emulators on cell phones then real ones. I wonder if he goes to their forems and rants about them all being thieves now? Bigger audience!

Rick

You attended college and yet mix up "then" and "than"? Well, it would at
least be wise not to boast about it. Additionally, it's not considered
nice to call someone a jerk and assume he had a worse education than
yourself, in fact in my home country bad manners are considered to be an
obvious sign of bad education.

...and even there you were wrong, as the stock XF551 disk drive stores 360 KB of data on a DS/DD diskette or 170KB on SS/DD one. But as I carefully tried to indicate to you already, there are better solutions available and they already were back in the 1980s.

You really do know a whole lot more than me about computers in general and especially about stock Atari hardware, no doubt about that.

The VBXE is not a mass-market product, for Sebastian is fully aware that there is only a three-digit number of Atari enthusiasts who would spend the amount of money on their A8 hardware he asks for this expansion (me being one of them). Those enthusiasts are very likely to already own expanded disk drives, SIO2SD/SIO2USB/SDrives, IDE or SCSI hdds and the like, and those not that enthusiastic about their A8 gear will most likely get along quite well with a stock 800XL with 1050 and any cheaply available means to exchange data with their PC or Mac.

I don't know how you expect anything of the more recent homebrew products to "help" the "Atari community" (help them with what btw?), but personally, I appreciate it when someone like Sebastian comes up with something new and exciting and do not try to talk it down.

Ah, I see. :) I've always been a fan of Atari800WinPlus, but the lack
of VBXE support means I'll be doing more development with a cross-
compiler and a real Atari hooked up via SIO2PC. And as for the 1200XL:
always yearned after one of those!

EOT we can only hope. You come here out of the blue with your first post insulting then take exception to being called a jerk?

I would give you some usenet etiquette lessons like go through a few old posts and that spelling flames are frowned upon before further exposing yourself as ignorant but you seem to want to make a career of it.

This has gone on far enough, I will get specific.

You took offense where none was intended and as such posted irrelevant and insulting drivel. My comment about VBXE:

"Spectacular on a hacking and technical competance level of course"
<ok, competence>

No amount of running a spell checker, trying to change the point of contention, or back peddling will change your blunder. You took offense where none was intended and started off flaming on the basis of your mistake. My negative comments were directed at the Atari processing speed and stock I/O. My comments about VBXE would be considered by sane people to be a complement to the designers.

Most of the people in this newsgroup have known me for 15-25 years. In that time I doubt if I have ever attacked any hardware designer or for that matter programmer as you seem to want to portray my post here. Rude and ignorant behavior I do take exception to of course.

> EOT we can only hope. You come here out of the blue with your first
> post insulting then take exception to being called a jerk?

You considered my first post insulting because I corrected your false assumption that someone with a VBXE would start disk juggling with single/enhanced density disks on a stock 810 or 1050 disk drive to get a single multi-colour picture displayed (as if neither compression algorithms nor the XF551 and other mass storage devices with higher capacities existed) and your false claim that the SIO speed is the same speed at which a non-modified stock Atari disk drive sends data.

Well, then you are insulted by facts, and I'd better not tell you that "Bomb Jake" - which needs 256 KB of extra RAM - has recently been compressed to fit on a single 127 KB disk.

If this lightning struck you out of the blue, the level of knowledge on this newsgroup must have seriosly degraded.

> I would give you some usenet etiquette lessons like go through a few
> old posts

I have read the thread from the beginning (RFC 1855 3.1.3.).

> and that spelling flames are frowned upon

If someone boasts as openly as you about his oh-so-high level of education and his oh-so-long presence "on the internet" and - in this posting "in this newsgroup" and at the same time makes grammar and spelling mistakes like a child (and not the most clever one, I might add), I find this amusing. Whether you consider it "flaming" (after calling me a "jerk" and trying to implicate I have a worse education than yourself, remember?) to point this obvious discrepancy out does really not matter to me.

> "Spectacular on a hacking and technical competance level of course"
> <ok, competence>

Your technique to rip short quotes out of their greater context to "prove" that you didn't express what you did might be amusing for someone who has no experience in this style of discussion - you are apparently still suffering from the delusion that I am new to Usenet because I don't write in this group as often as you. You inability to counter any of my claims and arguments and to answer any of my questions - it is obvious that's why you are not quoting and/or responding to

anything I wrote - does not speak for you.

> My negative comments were directed at the Atari
> processing speed and stock I/O.

The VBXE has very advanced blitting capabilities to take the load off the CPU just because of that, as you could have easily found out reading the specs on vbxe.atari8.info. And the stock I/O speed of the A8 is depending on the interface used (PBI is much faster than SIO, which itself is around 78000 bps - HSS-Copy with modified 1050 drives even achieves 96000 bps on a stock XL/XE).

Thorsten

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Good advice.

Boing!

If you think you can jerk a judge around with patently bullshit answers
that are the equivalent of saying "Prove it!" while giving him the
finger, think again.

Judges are not stupid. They are cranky, conservative old men,
infatuated with their own estimate of their abilities, with a jaundiced
view of the rest of mankind, and drunk on the power they have exercised
over others' lives, true - but they aren't stupid.

And courts are not just about old men in fusty wigs, funny clothes, and
oak paneling. Behind that veneer lies power, naked and raw, with very,
very sharp teeth. Cross them and that power will be brought to bear
very forcefully indeed.

If you find yourself in court you have already lost - bigtime! Even if found innocent it will be a sentence of bankruptcy with perhaps your marriage, your career, and your future in tatters. That's the upside.

So make sure you don't find yourself there. But, if you do, I suggest presenting a very submissive and very respectful demeanor. Unless, of course, you'd like to go out in a blaze of glory, a hero to us all, as you begin your long sentence :-)

Hello, Bruce!

I don't know what you use, to read the comp.os.cpm Newsgroup.

Me, I use Windows 98SE and Outlook Express 6.

Because Windows and Outlook Express (and Internet Explorer) are the standards, in local cybercafes. I have never seen a cybercafe use Linux. There was one small cybercafe whose owner was a fan of the Mac, but he went bankrupt, following a move near a supermarket (its customers did not went to the new location).

So, since I use "boxes" to surround my tables in WordStar, I investigated how to show them properly, once published on the comp.os.cpm Newsgroup.

Under Outlook Express, there is a "Affichage" (Display) pull-down menu. One of its options is "Taille du texte" (Size of text). The last option is "Fixe" (Fixed). It works but, unfortunately, you need to select it each time...

One day, I finally found that "Outils" (Tools) -- "Options" (Options, the last option, at the bottom), had a "Lecture" (Read) "button". When you click on it, you see a I/O window, with "Polices" (Fonts) at the bottom. When you click on it, you see another I/O window, with the first 2 pull-down menus being "Police proportionnelle" and "police à largeur fixe" (Proportional font and Fixed font).

When I started using Windows, 10 years ago, there was something called "System" font. The name seems to have changed. Nowadays, I usually find one "Lucida Console" font which does the job. Once you click on "Ok", the program remembers that it must use a fixed font to display the comp.os.cpm Newsgroup messages. This has worked for me for several months. I read the comp.os.cpm Newsgroup messages in a fixed font. All that is missing is green characters on black screen. (And "single column" characters.)

Yours Sincerely,
Mr. Emmanuel Roche, France

I forgot to say that, when I publish a WordStar file in the comp.os.cpm Newsgroup, I see it right-justified on the screen, since I reformat the text to 64 columns. Apparently, Google Groups only allow 67 columns of text. I have no idea why they chose such a curious value, rather than the 72 columns of MBASIC, coming straight from the ASR-33 Teletype. All my 8-bit computers (and typewriters) have 80 columns. Even my Daisy-Wheel printer had 136 columns. This must be progress?

Yours Sincerely,
Mr. Emmanuel Roche, France

3642. The Atari Music Network is Live!

Newsgroup: comp.sys.atari.8bit
Date: 2010-01-02 16:14:50 UTC
From: Donovan <donovan.kokot@gmail.com>
Message-ID: <ad38f79a-68a0-4c2e-809c-5b9949e1f8f8@k23g2000yqa.googlegroups.com>
Source record: 1731

(WEBSITE) http://www.atarimusic.net
(FORUM) http://www.atarimusic.net/atari-music-network

From sequencing Tangerine Dream concerts in the 80's to tearing up the dance floor at the New York Blip Fest in 2010, Atari's reputation as a music monster machine has persisted for a quarter of a century. The secret behind its success is clear: Atari was perfect from the beginning – it didn't need to change. For MIDI enthusiasts, the Atari was and still is the ultimate bridge between man, music, and machine. For chiptunists, the Atari offers a canvas of unexplored sonic colors for electronica and 8-bit pop. AMN believes that Atari isn't just about nostalgia; its about utilizing an alternative computer platform for specialized digital music creation.

On Jan 1, 2010, The Atari Music Network (AMN) was launched, marking the beginning of an exciting new era for Atari based musicians and developers by offering news, resources, and an extensive social network area.

The Atari Music Network (AMN) Mission Statement and Features

The Atari Music Network (AMN) aims to:

• Stimulate social interaction of Atari based musicians and developers as one global community.
• Inspire and support Atari hardware and software developers to update and resell their products or place abandonware into the public domain.
• Deliver relevant news, product information, downloads, and hardware support
• Provide free marketing for Atari based musicians, albums, and events
• Bolster Atari's presence in the 8-bit pop scene
• Archive, catalog, and preserve Atari music software for future Atari generations
• Encourage the pirating and cracking of ex-commercial software (ethical rules apply)

AMN Currently Features

• Discussion Forums: The Heart of the Atari Music Community
• Worldwide Ebay Power-Searches: Dozens of Predefined Atari Hardware and Software Searches
• Facebook Group: Connecting AMN to a Wider Audience
• Featured News & Articles: Showcasing Atari Musicians, Developers, and Events
• Frankenstein Mods: How-to Guides of user's Hardware Hacks and Mods
• Hardware Catalog: An Archive of Music Related Atari Peripherals

• Software Catalog: Music Software Downloads Including Freeware and Cracked Abandonware

AMN Future Features (To be Announced)

• Atari E-Store : A Centralized, Secure, and SEO Enhanced E-commerce site to help developers reach a wider target audience
• Artist's Self Promotion: Dedicated Profile Pages for Artist's to Create Sample Albums and Promotional Materials

You can also join the Atari Music Network Facebook Group here: http://www.facebook.com/home.php?filter ... 5513878661

3643. cc65 version 2.13.1 is available

Newsgroup: comp.sys.atari.8bit
Date: 2010-01-02 21:49:54 UTC
From: uz@spamtrap.musoftware.de
Message-ID: <hhof22$4d7$1@moppi.musoftware.de>
Source record: 1732
Cross-posted to: comp.sys.cbm,comp.sys.apple2.programmer,comp.sys.atari.8bit,comp.sys.oric

I'm proud to announce version 2.13.1 of cc65. cc65 is a complete cross development package for 65(C)02 systems, including a powerful macro assembler, a C compiler, linker, librarian and several other tools.

cc65 has C and runtime library support for many of the old 6502 machines, including

- the following Commodore machines:

VIC20
C16/C116 and Plus/4
C64
C128
CBM 510 (aka P500)
the 600/700 family
newer PET machines (not 2001).

- the Apple][and successors.

- the Atari 8 bit machines.

- GEOS for the C64 and C128.

- the Nintendo Entertainment System (NES).

- the Supervision console.

- the Oric Atmos.

- the Lynx Console.

The libraries are fairly portable, so creating a version for other 6502s shouldn't be too much work.

This version is a bugfix release against 2.13.0. Changes have been made in the following areas:

* Added a missing external declaration for ser_load_driver.

* Fixed an error in the 32K linker config for the Commodore VIC-20.

* Fixed a problem with bit-fields.

* Fixed a problem with initialization of local arrays with unspecified size.

* Function designators are now handled correctly when dereferenced.

* Corrected a problem with qualifier handling in arrays and structs/unions.

* Passing structs by value was never possible but is now correctly refused
by the compiler.

* Ignore unknown preprocessor directives in an #if group that is excluded.

* Apple][target makes use of bit-fields in dirent.h.

* Documentation improvements.

Precompiled binaries are available for the most common platforms. On many
other host platforms, the sources compile out of the box, so you'll able to
create your own binaries.

For RedHat Enterprise Linux 5, ready made RPM packages are available. These
packages may also work on other rpm-based Linux systems. Please note that
there are separate RPMs for the compiler proper, the docs, and the target
specific libraries. To develop code for one of the target machines, you need
the compiler RPM package *and* one of the target machine packages. Be sure to
download the documentation package if you're new to cc65.

For windows users, there's a user friendly installer package (the one with the
.exe extension). All subpackages are selectable from within the installer
dialogue. The installer will also setup the necessary environment variables
and start menu entries. It is recommended that Windows users choose this
package instead of the .ZIP files.

Precompiled binaries for DOS, OS/2 and Windows are available in ZIP archives.
As with the RPM packages, you need the package for the development host system
(Windows or whatever) *and* one or more of the target machine packages, plus
optionally the doc package.

All packages are available from the MU software FTP server:

ftp://ftp.musoftware.de/pub/uz/cc65/

More information on cc65 can be found on the cc65 web page at

http://www.cc65.org/

There is also a mailing list for discussing cc65 related issues (programming,
suggestions, bugs, ...). See

http://www.cc65.org/#List

for information on how to subscribe to this list.

While I'm the main developer of cc65, it is actually a joint effort. I would
like to thank the target library developers, all the people on the cc65
mailing list, all those sending suggestions and feedback, and even those
bugging me for a new stable release:-) The CREDITS file is probably
incomplete, but you know who you are.

Thank you!

Uz

Hi,
Good stuff! Any chance of seeing full support for SuperCPU (65816)?

No, I considered your first post to be insulting and more importantly to have jumped to the WRONG CONCLUSION. Quit trying to change the argument. You were wrong in then and you are still wrong now. Trying to make this a spelling bee is just immature stupid. From there I was just jerking your chain aka trolling. The farther you got into it, i.e. explaining you were defending people who design hardware while attacking someone, myself, who has contributed to hardware and software for the last 25 years is a good example of your level of logic.

Just go away, you have nothing contructive to contribute here and are just digging yourself in deeper. The problem is you should have reread my post and said "Excuse me, I see you were talking about the Atari market and not the developers of VBE." but instead you chose to talk about how bright you are. Kind of funny really. Heck, what ever floats your boat.

You see that is another logic flaw. Somebody with a Nobel prize may be wrong and conversely someone with a room temperature IQ could be right. This is such an obvious blunder it is usually given in latin "ad hominem" to show it has been known as faulty logic for some 2000 years or so.

People make that mistake all the time. We just had a bunch of knucleheads cross posting from the apple group where one of them made the argument ~'he is on 8 patents so he must be right.' If number of patents was the determining factor he would have still been wrong.

For those unfamiliar with Kevin Savetz and his
"Classic Computer Magazine Archive" (http://www.atarimagazines.com/),
it's a digital archive of classic computer magazines. It started
as the "Digital Antic Project," to archive an Atari-focused series
of magazines, but since expanded to include STart (Atari ST),
"Compute!" (various microcomputers), Hi-Res, Amiga Plus, Whiz Kids,
II Computing, as well. The magazine contents are made available with
permission from the publishers.

I'm friends with Kevin on Facebook, and he just posted this:

I've been making huge strides in getting new content online, after
months of inactivity. For starters: 8 new issues of Compute! magazine
added in the past few days, and more really good stuff is coming soon.

You can follow the progress via RSS at http://www.atarimagazines.com/new.rss

or Twitter at http://twitter.com/computerarchive

or the new mailing list, sign up at
http://www.atarimagazines.com/new.html (that's the best way, in my
opinion)

The latter two options give news about www.atariarchives.org and
www.flightsimbooks.com as well as www.atarimagazines.com

Enjoy!

How about coordinating with Cyberoach on the A.N.A.L.O.G.s?
Things seem to have bogged down over at his archive...

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

I was searching the web archive and thought I would see if they had a copy of my old web site. Turns out they did but it is just as bad as it was back then. Heck, 1997 and I think I had just finally broke down and got W95 so I could play Diablo or something else equally as dusty.

The front end had some non serious problems, namely the links appear twice and when I left netmagic ~5 years later I still hadn't fixed them.

It wasn't meant to be a dummy front end but most of the action took place behind the scenes. WWW at the time meant you could FTP to a public directory where I kept a bunch of files that couldn't be reached from the web interface.

3656. Integrating an Atari 800XL into an entertainment center

Newsgroup: comp.sys.atari.8bit
Date: 2010-01-07 15:30:05 UTC
From: "John H." <john.heitmuller@jrfcorp.net>
Message-ID: <3669856f-d6e2-451c-a537-1bc20871198c@d7g2000vbs.googlegroups.com>
Source record: 1745

Hi All,

I'm setting up a new entertainment center for my family room with all of the standard modern fair, large LCD TV, BlueRay player, Tivo and such. I thought it would be fun to pull out my old Atari items from storage and permanently connect an Atari 8-bit into my entertainment center via composite video. I've got several Atari 800, 800XL, 130XL, and 1200XL systems.

I'm thinking of using an 800XL. I think the biggest challenge will be cable management for the power, video and possible a disk drive cable. Does anybody have any clever suggestions for this project?

Thanks,
John

> cable. Does anybody have any clever suggestions for this project?

I don't really have what you'd call an "entertainment center" more than
"a TV stand with a cabinet and a drawer."

A variety of game systems live in the cabinet, right below the TV:

| Atari 7800
Sega Genesis | Sony PS2 Slim
Nintendo NES | Sega Dreamcast | Atari Jaguar | Nintendo Wii

The NES is mostly-front loading. The Genesis, DC, Jaguar, 7800 and PS2
are all top-loading (so the 7800 is kind of 'in the way' of the PS2).
The Wii (new addition to the family!) is front-loading.

So I was able to stack them, as ASCII'd above, and it's not a horrible
abomination.

The 800XL lives inside the drawer, along with a ton of DVDs.
It's a bit crowded. Since it's inside a drawer, it's not easy to
type on, but 99% of the time you're just hitting Start/Select/Option.

I simply wire everything over the back of the drawer; the power
adapter lives on the floor. I use an SIO2SD (dangerously caseless
at the moment!) for booting. It's powered off the SIO port, so
it doesn't require a power cable. I simply leave it at the top right
of the 800XL (right of the cartridge port).

Hey, that makes me curious... with the wonders of wireless
controllers (we have one for PS2 and the Wii, of course... and
back when we had a Gamecube, we had a Wavebird), I should look
into wireless Sega Genesis controllers!

Off to check amazon...

Got a friend, who is looking for a working Sparta Dos X cartridge.

He is willing to pay a reasonable price for one.

Post or contact me as phantomm@suddenlink.net if you have
one for sell. He wants to know asking price before agreeing to anything.

I have my 800xl hooked upto an LCD TV! Doing both Composite Video & S-Video!
I use an adapter that adapts Chroma-Luma to S-Video! It's Bi-Directional!
Chroma-Luma and S-Video are basically the same thing with an Adapter!

Are you using it in an emulator or do you play it on a real machine? The
problem with FS II is its copy protection. If it doesn't find the disk
timing correct, which you can only get from the unmodified original
disks, it breaks after a short while.

So long,
Thomas

Wihtout a doubt s-video is better than composite: the luma and chroma signals are separate. However, they're still connected on the mainboard (hence artifacting), so results can vary and it really depends what kind of display you're looking for. I achieved the best possible s-video picture from my 800XL by removing the RF modulator and severing all connections between luma and chroma (and thus destroying the composite video out: http://www.atari8.co.uk/projects/). This doesn't work for everyone, though, and trying the same trick didn't work so well on the 130XE. However, you should get decent results with the kind of s-video cable readily available on eBay which has a diode on the chroma designed to reduce noise and vertical banding.

Your friend would probablt be better off buying an AtariMax flash
cartridge:

http://www.atarimax.com/

Then going here:

http://trub.atari8.info/index.php?ref=sdx_upgrade_en

and downloading the flash ATR and making his own SDX cart. The latest
versions are a dramatic improvement on the originals and they're free.
The last original SDX cart I saw on ebay was about $150.

On the other hand, if anyone would like to spend $150 on an original cart,
feel free to drop me a line. :) For this guy, it may come down to whether
or not he needs a passthru cart. If not, then I'd agree the MaxFlash cart
is a great way to go. Also, I saw a somewhat recent post on AtariAge
detailing a modification to allow the new SDX into an original cart:

FWIW: The 130XE has about the best video of the series. If you have an
800XL or 1200XL the video mod is just about required.

I usually just use a DIN connector with all the pins brought out. You
can use Composite Luminance and Composite Video<?Chrominance> plugged
into the S-video of your monitor. With a 130XE it comes out clear to
the point where games like Ultima III no longer have artifacting and
look like a graphics 8 screen.

Thanks for the info,

I don't have to have the X cart, For what I'm doing I can use the disk
based 3.2D.
I use to have a bunch of those carts but sold, traded them as time went by.
Just like to have one to complete my old setup.

3673. GORF cartridge

It is a powerful DOS that can alphabetize the directory and
display binary file load vectors as well as do some batch file
processing among its added features. I got a copy in the '80s
and had no manual until I found it online in the '90s. IIRC, it
lost DOS 2.0 compatibility in enhanced or double density or
writing that sorted directory back to the disk as it dropped
the file number and forward sector chain pointer from the last
3 bytes of each sector. Fell into disuse when MyDos 4.x went
public domain plus we had modified A.N.A.L.O.G.'s DiskTool
by adding all of the functions we needed.

I just tested a set of Wireless Joysticks for the Atari 2600. I did it on my Atari 800XL, and it works! I need to warn you, these Joysticks require a Power Supply, the kind for an XEP-80, SX212 or an Atari 2600! The bad news is the Wireless Joysticks dont come with Power Supply! You must Supply your own! I have a Boxed Set!Please Reply Irregardless of your Answers! Thanx! =-=Ben=-=

Atari800 is a nice multi-platform open source one.
(I use it on Linux, and have used it on Windows.)

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Does your TV have the cabability of hooking up
a PC through a monitor jack? If so, then it is
easy. Just use a C64 monitor cable and a video
converter. I hook my XE up to a SVGA monitor and
it looks great.

ok, Which programs, or types of programs will not work using the emulator?

Any problems running Atari Basic programs?

And how is machine language routines handled, do these work too?
```

3691. XEP 80 experienced advice needed

Newsgroup: comp.sys.atari.8bit
Date: 2010-01-17 17:15:17 UTC
From: phantomm_1 <phantomm@suddenlink.net>
Message-ID: <4b5345a7$0$5327$bbae4d71@news.suddenlink.net>
Source record: 1680

I've a Xep80 still in the box, like new.
I've never used it,
Anyone reading this group use or have used an XEP 80?

If so, I want to know does it allow all programs to work in 80 column?

What are the best and worse things about it??

I was wondering if it would work with BBS software, such as
BBS Express , or some of the other BBS programs?

Are there any other drivers for it other than the standard Atari
driver? Or any other uses?

I appreciate any info you can provide

3692. Experienced ICD MIO Users

Newsgroup: comp.sys.atari.8bit
Date: 2010-01-17 18:23:12 UTC
From: phantomm_1 <phantomm@suddenlink.net>
Message-ID: <4b535593$0$5364$bbae4d71@news.suddenlink.net>
Source record: 1681

zGreetings,

Regarding the ICD MIO, I would think one should be able to do more
with that 50 pin Connection..

I bought mine already setup with an Adeptic 4000A Controller Card,
attached to, 2 hard drives.

Things have changed alot now, but back then, did one need a Controller Card
to
use a hard drive or did it depend on the drive?

Can one still find any hard drives to work with the MIO now?
I have 2 or 3 older JF

Has anyone tried using the 50pin connection of the MIO with anything without
using a controller card?
Now there are controller cards for all kinds of things, looks like one could
use
some of these to setup something cool. The Built in Menu would probably
have to
be changed, but surely this could be done with a software patch, or a
hardware
upgrade/patch.

It's a shame to let such a nice piece of equipment die off.

I've never had a Black Box from CSS, but from what I've read, they are
really nice as well.
I still have one of their old catalogs here somewhere.

3693. Re: 8bit emulators on PCs and Macs?

phantomm_1 <phantomm@suddenlink.net> wrote:
> ok, Which programs, or types of programs will not work using the emulator?

That's hard to say -- I think most programs will work with Atari800,
though some of the trickier graphics things may have trouble
(like 8 player/missiles on a scanline, etc.) Though in some cases,
those might now be supported.

> Any problems running Atari Basic programs?

Nope!

> And how is machine language routines handled, do these work too?

Yes, it's a full emulator. It emulates the 6502 CPU (sorry if I got the
model number not 100% right ;)), ANTIC and GTIA graphics chips,
POKEY sound/etc. chip, and so forth.

It works with both disk images (raw data representing all of the bits
of data on a floppy or hard disk -- DCM and ATR files, for example),
cartridge ROM dumps, and even stand-alone binaries (EXE, COM, XEX, etc.).

It can also access the host filesystem (that is, your Windows, Mac,
Linux, etc. filesystem) and printer (as H: and P: devices, respectively).
It also supports input devices... you can use the host system's joystick
(Stelladapter is useful here; lets you plug a real Atari joystick into
your PC or Mac's USB port!) and can even use the mouse as:

* paddle
* touch tablet
* koala pad
* light pen
* light gun
* amiga mouse
* atari st mouse
* trak-ball
* joystick

It can emulate an R-Time 8 cartridge, boot from cassette, emulate
the Atari 5200 game system (since that platform is so close to the
Atari 8-bit line of computers), supports extended memory, run in both
PAL and NTSC modes, and emulate a stereo setup (dual POKEYs, aka the
"Gumby" upgrade).

There are options for managing sets of disk images, swapping disks
(e.g., if you have an ATR image of "Disk 1, Side 1" and another
of "Disk 1, Side 2", you can easily 'flip the disk' by having it

swap disk images). You can also save state (dump memory/etc.)
and load it back later (kind of like 'suspending' a modern laptop).

It can take screenshots and record sound.

And finally, you can jump into "monitor mode" and debug or hack
stuff directly. (I have no idea how to use that, personally.)

And, it's open source, so you can examine and modify the
source code, help the project, port it to fun new platforms
(I've got an older version burned onto a CDROM that boots on
my Sega Dreamcast -- no modchip or hack required, btw!)

Enjoy!

}Things have changed alot now, but back then, did one need a Controller
}Card to use a hard drive or did it depend on the drive?

Yes. Bottom line was you required a controller; you could say it depended on the drive, but it really only depended on whether the drive had a built-in
controller on board. This per the manual and the previous owner.

I Have not tried any modern HDDs since the MIO was already configured with two old, old 10 MB 5.25 HDDs when acquired around '88-'89. It has performed well with few problems, but I may be sunk when it needs repair, due to my limited tech abilities.

Your ideas for improvement and expansion sound intriguing.

-Jess

BobTerm has a driver for the XEP80 to do both 40 & 80 Columns! =-=Ben=-=

---------- Forwarded message ----------
Date: Sun, 17 Jan 2010 12:15:17 -0500

I've a Xep80 still in the box, like new. I've never used it, Anyone reading
this group use or have used an XEP 80? If so, I want to know does it allow all
programs to work in 80 column? What are the best and worse things about it??
I was wondering if it would work with BBS software, such as BBS Express, or
some of the other BBS programs? Are there any other drivers for it other than
the standard Atari driver? Or any other uses?

I appreciate any info you can provide

3697. Experienced ICD MIO Users

I dont understand why you would need a Controller! Doesnt SCSI have it built
in?

---------- Forwarded message ----------
Date: Sun, 17 Jan 2010 13:23:12 -0500
From: phantomm_1 <phantomm@suddenlink.net>
Newsgroups: comp.sys.atari.8bit
Subject: Experienced ICD MIO Users

Greetings, Regarding the ICD MIO, I would think one should be able to do more
with that 50 pin Connection.. I bought mine already setup with an Adeptic 4000A
Controller Card, attached to, 2 hard drives. Things have changed alot now, but
back then, did one need a Controller Card to use a hard drive or did it depend
on the drive? Can one still find any hard drives to work with the MIO now?
I have 2 or 3 older JF Has anyone tried using the 50pin connection of the MIO
with anything without using a controller card? Now there are controller cards
for all kinds of things, looks like one could use some of these to setup
something cool. The Built in Menu would probably have to be changed, but surely
this could be done with a software patch, or a hardware upgrade/patch. It's a
shame to let such a nice piece of equipment die off. I've never had a Black Box
from CSS, but from what I've read, they are really nice as well. I still have
one of their old catalogs here somewhere.

The Adaptec <and Xebec> were actually SCSI to MFM [adapters,
converters, bridge, ...]. I *think* they may have made an RLL version
too but I can't recall any product numbers. It would take a deep
google search to find them.

IIRC What happened was IBM kind of set the market using an MFM 10 meg
drive in their PC. SCSI was in many ways a superior interface but it
requires more smarts in the drive. For instance, you could have up to
7 devices on a SCSI bus consisting of hard drives, printers, and CD
ROM. Few PC cards for MFM drives could handle more then two hard
drives and maybe a couple of floppies. Think of SCSI almost like an 8
bit wide Atari SIO bus.

So like everything IBM price for MFM drives was relatively cheap. I
recall when I upgraded from a 10 meg to 20 meg drive it was only ~$200-
$225 for drive and controller. For a while if you had a SCSI

controller I think it was actually cheaper to buy an Adaptec and MFM drive then a native SCSI drive. I think that was pretty much what Atari did with the 20 meg ST drive too i.e. 20 meg MFM drive with controller.

But what happened was SCSI went head to head with IDE when it came out. Wider, faster, bent more towards native IBM support. Drives started doing stuff like only supporting 512 byte sectors because that was all that was needed for IBM clones: This gave them problems with the Atari market and SCSI lost the war anyway.

Kind of a crap shoot for Atari compatibilty now. I mean you probably have to find a good MFM drive that will work with an adapter or an older SCSI drive that still has compatibilty. I think you are in general talking about 20-25 year old drives for compatibility.

For the record I went into Fry's last month and tried to buy a PCI SCSI card. The sales drone said "There will not be any PCI to SCSI cards available in any Fry's store." I ended up borrowing one from my son and buying another off eBay for $3: I was trying to pull some data off an old Syquest EZ135 drive. Everything seems to be USB, SATA, or IDE now and it looks like IDE may be going the way of sound cards.

Well, the board (MIO) is already there, and will work on all XL/XE machines
AFAIK.
I've used mine with a stock 130XE, a stock 800XL, and a 256K 800XL.
I like using the 256k 800XL the best for my MIO. The RamDisks can be alot of
Fun.
Also like having an Atari Printer and a non-Atari printer connected at the
same time.
I have one of the all time great printers, the Star Gemini 10. Which uses
type writer
ribbons. So no expensive Ink to mess around with.

One could redo the board, add on the stuff the ole 8-bit needs and PooF! a
new
system. I don't know why someone has not already done this.
The MIO hardware has proven itself to be reliable. But when the old hard
drives go
bad, not sure where to find replacements.

The Atari ST could use a external upgrade system in a box as well.

Interesting, I know that took alot of time to get all that working.
Any idea of how many people use the program?

Tons of people. It's been around for a very long time -- since 1995 --
and is open source. (On any Debian or Ubuntu Linux platform,
do "apt-get install atari800" to fetch it from the repositories. :))

It runs on numerous platforms: X11, Atari ST, Amiga OS, WinCE,
Linux SVGA mode, Windows DirectX, Mac OS X, MSDOS, and even in plain
text terminals (good for hacking something simple in BASIC, for example).

Its SDL target allows it to run on even more platforms
(BeOS/Haiku OS, Sega Dreamcast and Xbox game consoles,
GP2X and PlayStation Portable handheld game console...
just to name a few I could Google for quickly).

I think I have an Adaptec 4??? RLL controller; it is in
a custom wooden case with the drives, a fan and an AT
power supply. IIRC back in the day some folks were
formatting their MFM drives with RLL for the added
15 to 20% capacity at some risk of dependability...

> I have one of the all time great printers, the Star Gemini 10.
> Which uses typewriter ribbons.

I certainly agree with that assesment! My Gemini 15 lost the
bottom two pins in the print head a few years back and I have
had no success finding parts or repairs for that great old
workhorse. I loved program listimgs with the G colon device
showing all of the control and inverse characters.

Yep, From memory, there were several Adaptec controllers,
for MFM and RLL. I have a 4000A and another one, that
I think has a bad chip.
Not sure if you can still get those controller boards or not,
A few years back, I recall seeing some for sale as old stock.

I wonder if any better controller card can be connected to the
MIO for different devices/better hard drives?
It may be possible to rig up sometype of Flash Memory Drive
using the MIO.

This may have already been done on the 8-bits, I've not kept up
with all the different hardware projects.

I don't have any extra parts for the Gemini, I do have the original
manual. Which is for both the model 10 or 15.
They don't make manuals for printers like this anymore.
It's over 200 pages! Just glancing thur it, It even has info with
pics on replacing the print head. Programming the printer,
Character info.

(There is a replaceable fuse on the transformer which
is located inside the case where the power cord goes
inside the printer) Just in case someone reading has one that's
not powering up, it could be the fuse.

I could use some sproket paper, and sproket sticker labels.
The XMM801 Atari printer could really do some nice
pictures, but the pain was/is the printer ribbon.
After I printed my first 10 or so high res pictures,
I decided to use it just for text and smaller graphics
for letter heads/newsletter graphics.
Still have the printer, not sure if the ribbons are still
made or not. I recall that there was another printer
that used the same ribbon, but don't recall the name.

I used the NewsRoom, PrintShop, 1stXlent (wp)
atariwriter plus, TextPro and a lot of other DTP/WP
software back in the day.

The NewsRoom is a really nice DTP type program
for the atari 8-bit. I still have my original with the box
and was able to get the extra graphics disks.

If you still have that Gemini and want to sell/trade it.
I'd like to get it for a project. If the print head still moves it would
be great for use with a printer scanner I have for the ST.
It uses fiber optic cables that connect to the print head and
you can scan photos and etc using the printer.
It's a cartridge based system with disk software.
It's a old scanning system, but would be fun to
experiment with.

If there is anything I can help you with if you are still into Atari
stuff, just e-mail me. I've alot of different stuff.
And found a box full of atari related manuals, games and etc.

Does anyone recall any commercial or PD
Text adventure creation software for the
Atari 8-bit?

I'm sure I have a few programs, but don't
recall the names.

I'm looking for one that will allow me to
use graphics and sound in the text adventure.

Or just a plain one, if there isn't one that'll do
graphics/sound.

Also, looking for the names of the Best Commercial/PD
atari 8-bit Music related software.
Everything from Sound Digitisers, Sample Editors,
MIDI related, and etc.

And names of the Best Graphics related software.
Digitisers, Animation, Video related and etc.

Also, need programs for the atari 8 bit that do various
file, program conversion.
Such as converting between various Music files, graphic files,
and etc.

Another Curt Vendel find via Facebook: the ET100 ethernet
adapter for the Atari 8-bit(?). Looks (based on the
photo of a box or manual that he found) like the SX212 modem.

Anyone ever hear of this thing?

There's Clayton Walnum 'Adventurous Programming' Parts 1,2,3 in ANALOG
39,40,41.
I never used it, I suspect it might not work. Don't know if it does
graphics and sound,
doubt much graphics.
You might find the articles at cyberroach.com ANALOG archives.

I checked cyberroach, he doesn't have them. Any such programs would
be pretty hard to
figure out without reading the magazine article that goes with the
program(s).

Well, the original poster was asking about adventure _creation_
software. :) But yeah, there were Ultimas for the Atari 8-bit.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

3715. Beginning planning for Atari Party 2010 (Davis, Calif.)

Newsgroup: comp.sys.atari.8bit
Date: 2010-01-25 08:45:13 UTC
From: bill@newbreedsoftware.com
Message-ID: <4b5d5a19$0$1648$742ec2ed@news.sonic.net>
Source record: 1604
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,alt.atari-jaguar.discussion,alt.games.lynx

Hi all!

Last March I organized an event in Davis, Calif. that I called "Atari Party."
We had over a dozen Atari systems, spanning Atari 2600 through Jaguar, and
over 200 games for the public to come and play:

http://www.newbreedsoftware.com/atariparty/2009/

I haven't picked a date (or venue -- the public library in town, where
we met last year, is undergoing renovation thru mid-2010), but I've
started planning.

This year I'm thinking of bringing my Sony PlayStation 2, along with
a variety of PSX and PS2 discs I've got that contain Atari games
(e.g., "Activisiton Anthology", "Midway's ... Atari Collection 1")

Would anyone out here be interested in bringing systems & games
this year?

I've personally got 10 systems (including 2 non-Atari devices for
which I've got emulated Atari games: the PS2 and Gameboy Advance),
and 2-3 too few monitors/TVs to display them on. ;)

I've also got about 390 games (about 50 of which are dups; e.g, I have
a Combat cartridge, and my Flashback 2 has Combat).

Sorry if I'm incoherent, it's late and I'm distracted by a movie. ;)

Two part explanation: 1st I am trying to get Atari Active again. I went through a comical attempt to retrieve some of my old programming data. Looks like everything I had stored on three 20 meg hard drives has gone into the ozone. Went to the extent of formatting an old original IBM 10 meg drive just to make sure everything was working. Haven't checked my floppies but I am sure they have all gone south due to storage in a damp basement. Don't cry for me Ataritina! Virtually all of my old stuff was singularly unpopular even with me and I wrote it. Lots of joystick home control, character set editors, and RS232 type stuff.

I did manage to pick some stuff off an old Syquest SCSI drive which is the 2nd part. My memory is not perfect in that if something registers at the time and I say to myself ‘I’d better remember that’ it gets committed to memory. The converse is when I decide it isn’t important enough to waste any brain cells on. I forget all the simple stuff like where I put my car keys or what I had for lunch. Apparently I backed up what I could of a failing hard drive to the Syquest. About the only thing even remotely of interest was the source code for an Action! move routine that is up on umich archive. Foggy because I remember something along the lines of Bill Kendrick being involved like he found the problem with the PD routine being slow or I noticed one of his programs was slower then when run from cart or ??? Looking through the source and output files I’d say everything on the hard drive was broken except one TASM output file. As is my habit I commented the hell out of the orignal. I guess my amazement could have come from everyone using Zaks memory move instead of Levanthal/Levine. I still have the books but don't feel like looking it up. Since it is faster then the built in Action! routines, it makes it seem a little to bright for me. If I did figure out that odd/even double move independently then I am at least half bright. Anyway google does a better job of backing up posts then I do backing up hard drives so I don't lose it again...

```
0001 0000 ;
0002 0000 ;Quick & dirty quick move left. Make sure the
Dest and Source do
0003 0000 ;not overlap. It may still work depending on
the number of bytes
0004 0000 ;moved or if the Source is higher then Dest,
but don't take it
0005 0000 ;for granted.
0006 0000 ;
0007 0000 ;Written by Rick Cortese 6/18/96using the
Speech Technologies TASM
```

```
0008 0000 ;assembler for MS DOS. Basic standard core
routine from
0009 0000 ;Assembly Language Subroutines by Leventhal,
Levine.
0010 0000 ;
0011 0000 ;Calling convention from Action, Move(Source,
Destination, Size)
0012 0000 ;This should place the Source pointer at $A0,
Destination at $A2, &
0013 0000 ;Size at $A4. *NOTE* The Action manual is just
plain wrong on this.
0014 0000 ;For passing more then 24 bits of parameters,
the compiler calls a
0015 0000 ;routine to copy them to page zero. Near as I
can tell, it uses
0016 0000 ;the X register as an index & *FAILS* to
restore it! A & Y are intact,
0017 0000 ;& mirrored at $A0 & $A2, but you *MUST* LDX
$A1 if you want it to
0018 0000 ;have the proper value as described in the
manual.
0019 0000 ;
0020 0000 ;get some stuff defined
0021 0000 Source =$A0
0022 0000 Dest =$A2
0023 0000 Size =$A4
0024 0000 ;
0025 0000 ;It will be relocatable, but have to start it
somewhere for the
0026 0000 ;assembler. $680 is good since people with MAC/
65 can test it.
0027 0000 ;
0028 0680 *=$680
0029 0680 start
0030 0680 ;
0031 0680 ;If its less then 256 bytes, go straight to
clean up routine
0032 0680 ;
0033 0680 A0 00 ldy #0
0034 0682 A6 A5 ldx Size+1
0035 0684 F0 13 beq part
0036 0686 ;
0037 0686 ;Something that should have been obvious to
everyone looking for
0038 0686 ;speed, but I've never seen it used in any
general purpose routine:
0039 0686 ;A PAGE IS 256 BYTES! Once you decide this,
you could have 256
0040 0686 ; lda (Source),y
0041 0686 ; sta (Dest),y
```

```
0042 0686 ; iny
0043 0686 ;sequences with no branching! Since 256 is an
even number & to keep the
0044 0686 ;code a bit smaller but not much slower, an
even number of sequences with
0045 0686 ;a single branch at the end will invariably
hit a zero at the last
0046 0686 ;iny in the sequence!
0047 0686 ;
0048 0686 page_move
0049 0686 B1 A0 lda (Source),y
0050 0688 91 A2 sta (Dest),y
0051 068A C8 iny
0052 068B B1 A0 lda (Source),y
0053 068D 91 A2 sta (Dest),y
0054 068F C8 iny
0055 0690 D0 F4 bne page_move
0056 0692 E6 A1 inc Source+1
0057 0694 E6 A3 inc Dest+1
0058 0696 CA dex
0059 0697 D0 ED bne page_move
0060 0699 part
0061 0699 A6 A4 ldx Size
0062 069B F0 14 beq exit
0063 069D ;
0064 069D ;ok, here's where another leap in logic takes
place. You just found out
0065 069D ;the remainder is not equal to zero to get
here. The only other values
0066 069D ;it could be are 1-255. Now how do you get a
multiple sequence like
0067 069D ;above to work? Easy, just test bit zero! If
bit zero =0 then you have
0068 069D ;at least 2 bytes to move so the mutiple
sequence move above works. If
0069 069D ;bit zero does not equal 1, then you either
have a single byte to move
0070 069D ;or an odd number of bytes. By jumping to the
middle of the routine,
0071 069D ;you now have either moved the single byte or
converted the odd number
0072 069D ;of bytes remaining to an even number suitable
for the routine.
0073 069D ;
0074 069D A5 A4 lda Size
0075 069F 29 01 and #1
0076 06A1 D0 06 bne magic
0077 06A3 last
0078 06A3 B1 A0 lda (Source),y
0079 06A5 91 A2 sta (Dest),y
```

```
0080 06A7 C8 iny
0081 06A8 CA dex
0082 06A9 magic
0083 06A9 B1 A0 lda (Source),y
0084 06AB 91 A2 sta (Dest),y
0085 06AD C8 iny
0086 06AE CA dex
0087 06AF D0 F2 bne last
0088 06B1 exit
0089 06B1 ;
0090 06B1 ;Stick a:
0091 06B1 ; rts
0092 06B1 ;here if you want to call this as a
subroutine. The RETRUN in an
0093 06B1 ;Action program generates a rts & is needed
after the code block
0094 06B1 ;below to keep the compiler from getting
confused.
0095 06B1 ;
0096 06B1 .end
0097 06B1 ;
0098 06B1 ;In my tests, I found this to be about 10-12%
faster then the Action
0099 06B1 ;built in routine. I've never seen this
particular method done in
0100 06B1 ;a general purpose routine before, but then I
admit I haven't
0101 06B1 ;seen everything ever written for the 6502. I
did read every Antic,
0102 06B1 ;Compute, & about 1/2 the ANALOG magazines
between 1984 & the time
0103 06B1 ;when they disappeared & never saw a routine
like it.
0104 06B1 ;You could shave a few more tics off a move by
using the
0105 06B1 ; lda address,x
0106 06B1 ; ...
0107 06B1 ;method, but then the move would have to be
hard coded or self
0108 06B1 ;modifying. In the later case, the
modification process may take
0109 06B1 ;up more time then is saved by the routine.
0110 06B1 ;It seems you can teach an old dog new tricks.
0111 06B1 ;The code block to include in your Action
program is:
0112 06B1 ;
0113 06B1 ;PROC Move(CARD Source, Dest, Size)
0114 06B1 ;
[$A0$00$A6$A5$F0$13$B1$A0$91$A2$C8$B1$A0$91$A2$C8
0115 06B1 ; $D0$F4$E6$A1$E6$A3$CA$D0$ED
```

```
$A6$A4$F0$14$A5$A4$29
0116 06B1 ; $01$D0$06$B1$A0$91$A2$C8$CA$B1$A0$91$A2$C8$CA
$D0
0117 06B1 ; $F2] RETURN
0118 06B1 ;
tasm: Number of errors = 0
```

3721. Faster memory move routine (TASM + Action) (Was Re: Verbose Listing)

FYI - Plans for Atari Party 2010 move ahead!

(1) We'll be screening a movie (if not two!).
So far, the documentary "Once Upon Atari".

http://www.newbreedsoftware.com/atariparty/2010/movies/

(2) We'll be having a raffle, with some prizes donated to the event
by corporate sponsors:
* O'Reilly Media (gaming & retrogaming books)
* ThinkGeek ($100 gift certificates)
* Legacy Engineering (some USB Atari CX-40-style joysticks)

http://www.newbreedsoftware.com/atariparty/2010/sponsors/

(3) I whipped together a cute (I think!) piece of flyer artwork
for this year's party, using a collage of photos from last year
(in the late-1970s Atari 2600 game box art style):

http://www.newbreedsoftware.com/atariparty/oldstyle-web.png

(4) There are a pair of mailing lists you can subscribe to;

one (moderated) for news & announcements:
http://lists.sonic.net/mailman/listinfo/atariparty-news

the other (discussion list) for volunteer coordination & fretting:
http://lists.sonic.net/mailman/listinfo/atariparty

(5) And for the mailinglist-phobic, I've created a Facebook group:

http://www.facebook.com/group.php?gid=280573563703

I fell in love with the net and all the compuiter teahcnology in the very early years and have loved it ever since, I have an IT Degree and Communications degree and will be working on my doctorate for the next five years, in bwetween I design websites, databases, Multimedia Produxction or anything that wil make me a penny, just student scraping by. But Guess what? I don't want your money, your e-mail, or anything. Each of these sites has a specific topic but they have them style and layout sothey are easy to navigate and ther a search function should take you to exactly where youwant to, or just explore, they have outside service you can acccess as well. Each site has 10,000 plus articles and they are updated everyday so you know you are gettin up to date information. ENough, here the computer and tech related sites.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

3726. [Local] Atari Party in Davis, March 14th

Newsgroup: comp.sys.atari.8bit
Date: 2010-02-09 08:30:34 UTC
From: bill@newbreedsoftware.com
Message-ID: <4b711d2a$0$1643$742ec2ed@news.sonic.net>
Source record: 1615
Cross-posted to: comp.sys.atari.8bit,rec.games.video.atari,alt.games.lynx,alt.atari-jaguar,alt.atari-jaguar.discussion

Atari video game aficionados from near and far will host the second annual Atari Party in Davis, California on Sunday, March 14th.

Atari Party invites the whole family to a day of games, prizes, and even a little bit of learning. Test your skill with 300 video games on 30 game systems dating as far back as 1975, plus get a chance to win prizes in a free raffle, and learn about the golden age of Atari with a screening of the documentary film "Once Upon Atari."

Admission is free. Raffle prizes include USB joysticks, books, and ThinkGeek gift certificates.

Atari Party is March 14th from 12pm to 8pm at the Redwood Park Community Building, 1001 Anderson Road. For more information, visit:

3727. 800XL keyboard problem

Newsgroup: comp.sys.atari.8bit
Date: 2010-02-11 00:28:11 UTC
From: Daman <wayneeckel316@gmail.com>
Message-ID: <b4f9d657-0849-4610-8513-4560bf439957@15g2000yqi.googlegroups.com>
Source record: 1616

Hello Atari users. I was wondering if somebody can help me with my 800XL keyboard. the "-" key acts as it is stuck, and displays a bunch of ---------- on my screen. It isn't stuck, then key moves up and down like the rest of the keys do, so it isn't the springs.

Any Help?

3728. Atari 8-Bit Computers: Vendors and Developers

Newsgroup: comp.sys.atari.8bit

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be
listed here. "Active" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete
subscription or ordering information should be given, including prices.
Authorized online publishers of originally print or disk magazines are also
listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be
sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication
title. If no company name exists, a personal name is used. "See"
references indicate complete information may be found under the given
heading. "See also" references indicate closely-related information may
be found under the given heading.

The month/year that vendor information was most recently fully verified is
given at the "upper-right" of each entry.

Every entry should contain a valid postal address or web page address.

Unless explicitly requested by the vendor, no entries will include an email address due to the overwhelming amount of spam that would result.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

>
> Any Help?

If it has been taken apart I have seen the ribbon connectors not line
up or short.

If it doesn't cure itself or by repeatedly hitting the key you will
have to take it apart. After you get it apart if unplugging the
keyboard stops the problem then you may have a short in the keyboard.
If it still repeats w/o the keyboard plugged in there isn't a lot of
things it could be. Only two 4050 CMOS chips and the POKEY chip do
everything.

Rick

In comp.sys.atari.8bit Bill Kendrick <bill@newbreedsoftware.com> wrote:
> FYI - Plans for Atari Party 2010 move ahead!

The date is officially set:

Sunday, March 14th
12pm-8pm

At:

Redwood Park Community Bldg
1001 Anderson Road
Davis, CA 95616

See: http://www.newbreedsoftware.com/atariparty/2010/attend/ for
details, maps, directions and public transit options.

> (1) We'll be screening a movie (if not two!).
> So far, the documentary "Once Upon Atari".
>
> http://www.newbreedsoftware.com/atariparty/2010/movies/

We'll also be screening Disney's "Tron!"

> (2) We'll be having a raffle, with some prizes donated to the event
> by corporate sponsors:
> * O'Reilly Media (gaming & retrogaming books)
> * ThinkGeek ($100 gift certificates)
> * Legacy Engineering (some USB Atari CX-40-style joysticks)

Now listed here:
http://www.newbreedsoftware.com/atariparty/2010/raffle/

The raffle now also includes three Atari computer systems
(Atari 800 + 1050, an Atari 400 + 810 and an Atari 400).

Posting-Frequency: 10 days
Last-modified: November 16, 2009

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

3736. 4-player Tetris-style game idea

Newsgroup: comp.sys.atari.8bit
Date: 2010-02-17 06:42:33 UTC
From: bill@newbreedsoftware.com
Message-ID: <4b7b8fd9$0$1632$742ec2ed@news.sonic.net>
Source record: 1625

I just saw this:

"MULTRIS.ARC Multi Tetris is a tetris clone for the MultiJoy
interface. Use max. 4 joysticks for max. 4 players each filling up
their on column."

here:
http://www.mathyvannisselroy.nl/special stuff.htm

It occured to me, one could do a four-player Tetris-style game
on the Atari using two pairs of paddles.

Each player would 'twitch' their paddle to the left or right to
slide their piece, and push the paddle firebutton to rotate.
Perhaps push-and-hold firebutton to drop their piece to the
bottom.

Anyone feel like coding this? ;)

Some readers here may remember a Group I set up with others to provide and exchange information between users of 8-bit computers.

Well, one of the founders has passed away (died, that is) and Gordon Woolliscroft and I thought that as the whole 8bit scene has dwindled we ought to wind the thing up and put the money to good use, so that's what we've just done.

There was about 600 English pounds in the account (my, that interest did mount up) so we have decided to split it 50/50 between a kidney research charity and Great Ormond Street Children's Hospital.

We hope that meets with everyone's approval (cos it's too late to change it if it ain't!)

:-)

Sometime ago you mentioned an
Atari 8-bit game called Evening of Horror,

A while back I went thur, some of my disk library
and found it. However, this is the demo version.
Which allows you to play up to a point, then
provides a address where you can order the
full game.

It's a interesting text adventure with some nice
graphics screens. Similar to The Pawn.

I still have some more disks to go thru,
but, I don't think I have the complete
full version. If I find it, I will post something
in here.

3744. Other 4-player simultaneous paddle game ideas (was: 4-player Tetris-style game idea)

Newsgroup: comp.sys.atari.8bit
Date: 2010-02-19 02:22:10 UTC
From: bill@newbreedsoftware.com
Message-ID: <4b7df5d2$0$1662$742ec2ed@news.sonic.net>
Source record: 1633

Bill Kendrick <bill@newbreedsoftware.com> wrote:
> It occured to me, one could do a four-player Tetris-style game
> on the Atari using two pairs of paddles.

Some other 4-player, simultaneous-on-the-same-computer game
ideas:

* Multiplayer space battle ("Space War") or "Asteroids"
* Multiplayer racing (3D like Pole Position, Enduro or
Night Driving; or 2D like the GameLink game I saw,
"Speed-Up!", or "Championship Rally" on the Lynx)
* Multiplayer "Lunar Lander" (who can land first?)
* Multiplayer shoot-em-up (like "Space Invaders")
(I also realize there was "Demons to Diamonds", which
was 2-players facing each other... this would be
four players somehow sharing the ground at the bottom)

Heck, one could even make a jump-and-run game
(not unlike a simplified version of "New Super Mario Bros. Wii"),
since... for the most part, you use left/right/jump.

One I was thinking about that I'm pretty sure wouldn't
work would be a 4-player simultaneous "Combat" / "Tank"
game, since you need controls for both forward/back and
firing.

I could probably prototype a bunch of these in TurboBASIC XL.
("POKE HPOSP0+PLY,PADDLE(PLY)" ;))

3745. False Error 9 in TurboBASIC XL runtime?

Newsgroup: comp.sys.atari.8bit
Date: 2010-02-19 07:06:32 UTC
From: bill@newbreedsoftware.com
Message-ID: <4b7e3878$0$1589$742ec2ed@news.sonic.net>
Source record: 1634

I have a program I'm writing and I've got the following going on:

```
5 DIM X(4),Y(4),XM(4),YM(4)
...
100 FOR P=0 TO 3
105 X(P)=X(P)+XM(P)
...
199 NEXT P
```

I've used the TBXL compiler to compile the program (generate a .CTB),
but when the TBXL runtime hits that increment statement (line 105),
it falesly throws an Error 9 (out of bounds).

I tried bumping up the array size, but that didn't help.
So I've written this klugy work-around:

```
105 Z=X(P):Z=Z+XM(P):X(P)=Z
```

Seems to avoid the issue. Annoying, though...

Ooops, sorry, I've obviously not made it clear.

There was a third person involved with Gordon and I and it was he (not
Gordon) who joined The Choir Eternal.

Gordon is very much "still with us" as they say and it is he who has been
working so hard to wind matters up in the absence of the third signatory to
the account.

Bill Kendrick <bill@newbreedsoftware.com> wrote:
<snip>
> Some other 4-player, simultaneous-on-the-same-computer game
> ideas:
<snip>
> * Multiplayer "Lunar Lander" (who can land first?)
<snip>

A relatively playable prototype, in compiled TurboBASIC XL,
is available for your enjoyment:

http://www.newbreedsoftware.com/padlandr/

Turn knob left/right to change angle of your Lunar Excursion Module,
press Fire to thrust. Try to land (facing upright, and without
descending too quickly) on one of the flashing pads. Whoever lands
first is awarded a point.

Lots of ideas for improvement. No idea if I'll ever get around
to it, but hey... if someone wants to take the idea and run with it,
that'd be awesome. :)

Ever since the Wii came out, I've been thinking the Atari deserves
more 4-player games. :) (And I don't have a MultiJoy, and only
just acquired an Atari 800, so I've been thinking of ways paddles
could be utilized. :))

I think you may have an 'Oh in there where you think you have a 'zero
or some kind of DIM error. I just tried it out and it ran w/o errors.

Under the TBXL compiled runtime (RUNTIME.COM running a *.CTB file)?

I also discovered that math was getting kind of horked, when things
went negative. My lander was flying off the top of the screen
really quickly, due to this:

IF YM(P)<-4 THEN YM(P)=-4

It's as though the moment YM(P) became negative, that evalulated
to true, and caused the lander's speed to hit its max.

Simiarly, it would skip to the top of the screen sometimes:

IF Y(P)<-12 THEN Y(P)=-12:YM(P)=0

Like the moment Y(P) was less than zero, this would cause it to
jump to -12.

I simply copied all of the array(P) variables into 'local'
variables within the FOR...NEXT loop, and then copied them back
into the arrays when I was done, and suddenly the game ran
the same under the compiled runtime (RUNTIME.COM)
as it did under the interpreter (TBASIC.COM). Except faster,
of course. :)

100 FOR P=0 TO 3
101 X=X(P):Y=Y(P):XM=XM(P):YM=YM(P):REM get local copies
105 IF YM<-4 THEN YM=-4
110 IF Y<-12 THEN Y=-12:YM=0
120 REM etc.
198 X(P)=X:Y(P)=Y:XM(P)=XM:YM(P)=YM:REM copy back into array
199 NEXT P

Making the code & line numbers up as I type this, but it's
pretty much the jist of what was going on, and the changes I made.
```

Maybe I'm using a crappy version of COMPILER and/or RUNTIME?
(I'm using one that was in ARC that included "TBCOMP.DOC" composed
by Dave Arlington.)

shrug

Might as well drift the thread a bit. Kind of thinking in ASCII. Usual caveats apply, kind of comming out of a long period of procrastination so 8 to 10 years behind in projects. Priorites are a bit non-atari too in that my first priority at the momment is to get my sailboat ready for the summer.

Did some more thinking on multiplayer games. Thinking may not be what I do best but it is what I do most. I sympathize with the old school 'group of people gathered around the electric Atari Hearth' but I like the idea of over a network game too. I may have posted some of this

before but I am doing it refresh my thinking. I bought a web domain and my son put up a SMF web board so I will take it there from here on out so I don't get my usual flames. I can't tell you the number of times someone has called the 1489 version of SIO2PC [junk, trash, shouldn't work, ugly] for not meeting RS232 specifications where I just wanted to ban them by IP address. Now I will be able to!

I think it could be done with a packet assembler and tosser. I just haven't been able to burn enough brain cells to be confident in the best way to do it yet.

In the '80s when I was writing some specialty communication programs I wrote an R: interpreter. It had most of the equivalent BASIC statements so you could remotely run programs. For example if the BBS sent the string
#G GRAPHICS 2
The #G would be read as an escape sequence to go from text mode to interpreter. The local computer would then execute a GRAPHICS 2 command. Unfortunately I added a bit too much to it. It would accept binary load type commands for things like redefined character sets and had a USR() command. It was pointed out to me malicious people could use it to format someones hard drive so I never let it get out in wide circulation.

The problem with an old school BBS is you only get one or two people on at a time max. The Atari is even worse in that it typically only does one thing at a time and only uses one SIO device at a time.

I think most of the problems have now been overcome with networks and the internet. I am thinking of some of the early stuff like Kali, Warcraft, Doom over a network (DWANGO?), kind of examples but brought down just a bit simplier to get to the R:/consol level.

It's also a bit more appropriate for our user base. Approximations of course but you have about a million computers sold with probably half of them in land fills and most of the other half in closets and attics. I think the OSS sales data was only ~5k-10k per language which to me indicates even at the height of popularity maybe 2% programmed and only half of that took it seriously enough to buy serious tools like MAC/65. I think it is even worse for hard core stuff like MIO or Black Box. Looking at eBay feedback for j131 and Steve it seems like SIO2PC cables did around 5,000 units worth of business there. Keeps with my perception of the Atari Proles being cheap and lazy. They will spend $25 on a cable if it allows them to get a copy of every game ever made and play it. Forget about solder or taking the computer appart.

Anyway since my early efforts I wrote a BASIC for IBM clones: I learned about tokenizing! If I was to rewrite the R:interpreter now I would definately use tokens like [133, 134, 135] => [graphics, poke, print].

Which brings me back on topic of one way a multiplayer game on an Atari may work. If it to be used by the Atari Proles it has to have a lot of bang for the buck even if it is zero bucks. I think it just needs access to a network and at least one of the network computers to do some packet assembly. The individual actions of each Atari would be assembled and passed to all the computers using the serial port.

Let's say you have 3 Ataris in a network game of Pac Man. A one byte J/S status would be sent over the R: device to the network and a 3 byte packet assembled. The packet could either be assembled by one of the network computers or by one of the Ataris in peer to peer type connection if that is the right term. The three byte packet would then be sent out to all of the computers to update the local status.

If you do it via serial connection to network the only upper limit you have would be local processing power of the Atari. If you wanted 200 people in a game you could just use 200 byte packets. At ~19 kbaud you would still get more updates then shadow registers get updated but moving 200 objects on screen would tax the system.

Silly and trivial, you could have a blob type game of life. 200 people as 200 pixels. Maximum distance from another pixel limited so you would have to move on mass: Like an Amoeba eating crumbs.

Rick

For me it's two-fold. I want to keep things simple because:
(1) I am lazy. And forget about solder or taking my computer apart!
(2) Other people are as well, so if my game runs on stock HW, that's
a bonus.

This, plus no time to invest in doing things in anywhere near
a hardcore fashion, is why I don't have a MUX anymore.
I got rid of my MyIDE cart. My USB cart got busted (hard drop
onto the floor), so I just gave up on that, too.

Sure, I'd love to attach a PlayStation drumkit or guitar, or
figure out the magic necessary to get a Wiimote working with
the Atari, but if I went and wrote a game that utilized it,
there'd be pretty much a 1-person audience.

Heck, I'm sure that by making a paddle-based game, I'm killing
the audience of my game. (Which is why in my "to-do" list,
adding joystick support listed. At least then two people could
play lunar lander simultaneously, if not four. ;))

The other night I thought (again, from the paddle point of view) of
a Hover Boover style game, but with Roomba robot vacuum cleaners. :)
Yet another odd take on Pac-Man (which was odd to begin with).

Rambling, gotta focus on work,

Right, on Atari800 emulator. Renamed the code snippet to AUTORUN.CTB
and
binary loaded RUNTIME.COM to auto execute it. Added a few lines like
205 ?"Press any key to return to DOS"
210 IF PEEK(764)=255 THEN GOTO 210
220 END
<SNIP>

Is there a cut and paste for the emulator or do we have to go through an EOL converter programs? I have verified that some of my 'went for a swim in the basement' computers work but I don't have any set up with SIO2PC or APE. For that matter, I don't have a DOS computer that survived to run SIO2PC and I didn't stay in the game long enough to register either SIO2PC or any flavor of APE. I did run APE for Windows to make sure I had hardware functioning but it wasn't a permanent set up. Getting old and crotchety to the point of seeing a the APE startup nag or trying to get a DOS computer up and running gets me tuckered out.

Anywho, I was never real good with BASIC let alone Turbo BASIC but I figure it you may be right about munged file somewhere or it could be something harder to track, like loading RUNTIME.COM tries to execute something, anything, and by the time you get the prompt for ~Run what file? it is so confused it may be executing random fragments in memory, old code, or DUP.SYS area.

Rick

Blah, weird. Well, I didn't have time/energy to boil it down to
a test case. I was mostly annoyed that the game wasn't running
the same when compiled as it was when interpreted, so I jury-rigged
it until it did work. Then it was 2am, and way past bedtime.

All of my Ataris (except the 7800 & Jaguar, enjoyed on a semi-regular
basis by my toddler) are boxed up and ready for next month's
Atari Party. ;)

So I'm done worrying about it for now. (Who knows, though, I might
dump the TBS source code into a TXT file and try to rewrite it
into Action!)

Well, it isn't the cable. I have had the key itself apart and blew
into it with no luck. If I pry up on the key it will stop. If I take
the keyboard apart does that mean the little screws on the bottom?
When I get it apart, what do I need to look for then?

I've got a 1010 that I just inherited that you can have.
I have no idea if it works (the motor works, at least :))

Let me know. I'll just ask for shipping.
(Otherwise, I'll be trying to give it away at my Atari Party
in mid-March.)

Just a general rule. Initialize variables before using them.
```

Shoot, I posted before I was done.

Initialize variables before using them.
FOR P=0 TO 3
X(P)=0:XM(P)=0:ETC.
NEXT P
then you can do a X(P)=X(P)+XM(P)
also a good idea to use variables instead of numerics.
N0=0:N1=1:N2=2 ETC.
When you referenced X(P)=X(P)+XM(P) you can't assume X(P) starts as
zero.
Also, the CTB may be somewhat messed up.
```

Foggy memory but I seem to recall about 3 different keyboards were
made for
the XL. You are right, blowing probably won't do anything. Some of
the
keyboards if not all used a couple of sheets of clear plastic with
printed
traces and contact patches on them like a sandwich. Push a key in, it
squashes the layer with the conductive pad onto the one with the
traces.
Good news was it was sorta spill proof, bad news is after 25 years
they
are starting to deteriorate. SOP is to pull it apart and clean the
traces
with something that doesn't attack the plastic and repair the traces
with one of those conductive inks.

It isn't hard, just tedious. The ~20 tiny screws holding it together
are
really cheap and strip if you look at them wrong. I'm kind of ham
fisted so it'll probably be a snap for you.
I just looked at
http://www.best-electronics-ca.com
and didn't find replacement mylar for the XL. They did have it for
130XE types and looks like they have 1200XL keyboards<$45!!!>. I would
shoot them and
http://www.myatari.com
an email just in case. myatari aka B&C has 800XL pull keyboards for
$25,

Just trying to save you a buck. I think the last bottle of conductive
ink I
bought was ~$16 and I got charged ~$10 shipping.

I did a search at Best, and they have some QWERTY keyboards for
the 600xl/800xl here about halfway down the page for $30 each.

http://www.best-electronics-ca.com/800xl.htm

Oh they are in the real game:

FOR P=0 TO 3:X(P)={some math}:Y(P)=0:XM(P)=0:YM(P)=0:NEXT P

Recall that my first annoyance was a dim-out-of-bounds (ERROR 9).
Sorry my off-the-top-of-my-head example code I typed onto my
Usenet post was not complete enough. ;) (And certainly, in
the example, "P" was initialized by the FOR statement. Hehe.)

The math errors were ones where it was pretty obvious that
TurboBASIC XL's runtime's idea of:

IF VAR < -number THEN ...

was wrong. The game worked fine, until something (vertical
position ("Y(P)") or speed ("YM(P)") was negative, then it
was buggy. And it worked fine all the time, when running
under the interpreter.

Digital Millennium Copyright Act

The current administratively-created exemptions, issued in November 2006, are:

Computer programs and video games distributed in formats that have become obsolete and that require the original media or hardware as a condition of access, when circumvention is accomplished for the purpose of preservation or archival reproduction of published digital works by a library or archive. A format shall be considered obsolete if the machine or system necessary to render perceptible a work stored in that format is no longer manufactured or is no longer reasonably available in the commercial marketplace. (A renewed exemption, first approved in 2003.)

I really have to get out more, I never noticed this when it first came out. I'm no lawyer, barely a chemist anymore, so some of the wording seems arbitrary and open to interpretation. "reasonably available in the commercial marketplace" Who says what's reasonable? I can't go to Macy's and pick up an Atari 400 so does that mean everything Atari 8 bit is fair game eventhough Atari lives on with a paper trail of corporations buying it for name recognition value.

A more practical example of arbitrary may be something like the Black Box. I think Bob Puff is on record as saying he would do another production run *IF* there was enough interest => commercial. Its like one of those bad Star Trek episodes with a pretzel logic bomb.

The court, on a "case by case basis", this is what it means. As most
other laws, it is a guideline that is to be followed, no precise definition.

So long,
Thomas

<sigh>
It seems like a consequence of electing lawyers to make laws. I've
been
peripherally involved in intellectual lawsuits. The company I worked
for
had to defend several products from competitors and some even from
clients. i.e. if you don't wnat to pay royalty fees one 'percieved'
way out
was to attack the patent for prior art. We had several excellent
patent
attorneys but I think we also had to go with outside attorneys that
specialized in trials. Punch line is I remember giving a deposition
where it cost more per hour to park my car then I made!

Its one of those things that the general public doesn't quite get.
Intellectual
protection doesn't have copyright or patent cops working for the
government
that arrest violators. All it does is give you the right to take it to

court. This
looks like it is intended to get more lawyers employeed.

This doesn't change anything, a copyright holder could have taken it to court
before. All it does is issue a "Take it, you may get lucky" kind of statement.

Last-modified: November 16, 2009

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

3778. Adding Chips in the Atari Memory Map

Newsgroup: comp.sys.atari.8bit
Date: 2010-02-28 05:37:03 UTC
From: ricortes <ricortes@earthlink.net>
Message-ID: <8694c37c-638f-48b1-8919-45587f950c42@s25g2000prd.googlegroups.com>
Source record: 1517

In keeping with my scheme of getting a thing or two backed up to the web archive I documented a hack I did years ago. I may have posted it to the group or I may have only told Jeff McWilliams.<a name out of the past!>

In my usual left handed and crosseye logic I decided to buy my own domain name and post to it. I have a real beef with doing it to web site not under my control. For one thing I don't want it to be too dilute. You look at just about any web site with a forem and between the hankie fights and warez type posts the 'good stuff' gets lost in a crowd. I love the way google archives this group but no binaries kind of limits what you can do. Even with google search you still have trouble finding the post you are looking for.

It won't be much of a web page. I looked at the programming site Bill referenced and it looks great. Problem is they offer free programming and instruction and get no takers.

Easily 90% of my original code is gone. I may put up some other examples from various sites just so I have a central location to keep stuff.

Anyway, could someone check this for accuracy?
http://www.ataricorpse.com/index.php?topic=6.0

It is from memory about 10 or 15 years ago so... I also noticed and corrected an error in the schematic so it may not reflect the original that is floating around the web. The original had the pinout of the 74LS138 labeled wrong.

Rick

3779. Another paddle-game idea: something like "The Act"

Newsgroup: comp.sys.atari.8bit
Date: 2010-03-02 19:59:05 UTC
From: bill@newbreedsoftware.com
Message-ID: <4b8d6e09$0$1619$742ec2ed@news.sonic.net>
Source record: 1518

"The Act" is a prototype arcade game that utilizes cartoon
drawings (kind of like a modern take on old laserdisc games
like Dragon's Lair and Space Ace), but which is controlled
using a knob.

http://en.wikipedia.org/wiki/The_Act_(video_game)

Depending on the scene, the knob controls different
aspects of the game. For example, in one scene, the
main character that you control is attempting to flirt
with a woman. The knob controls how 'bold' the
character is at any given point. (You can become so
seemingly-disinterested that she gets up and leaves,
or come on so strong that she slaps you -- in both
cases, you lose.)

To do a game similar to The Act, you'd need gobs of
RAM or fast access to video frames (e.g., hard drive),
unless you get really clever about it.

But... we have a paddle, at least. ;)

I think the controller on The Act was a rotary
controller, so it could spin all the way around.
A game like this could be done with paddle,
trakball or rotary controller, I think.

Just thinking out loud. Back to work,

--

hehe!

http://etchartist.com/

I loved my paddles but mostly for taking apart so I could build goofy stuff like temperature sensors. I think I may still have a "driving controller" somewhere. I'm not sure if the general public realizes they used the direction coding system that begat trackballs, ST mouse, ... I did hate paddle drawing programs and I could never get good results from a Micro Illustrator pad. I did like bbk art but the copy I just down loaded seems to be busted. Doesn't work with the

emulator anyway.

Seems like a lot has been learned about human interfaces since the paddle days. I could almost see doing things like ptrig off X-axis motion, ptrig on Y-axis motion, ptrig click toggle pickup/drop, ptrig double click toggle select.

I thought you became a relative expert on character mode graphics? I mean anything that can be displayed in a graphic 15 mode can be done in a 1k graphic 12 mode plus a FONT. Back in the day it used to distress me that people used modes 8 and 15 when the obvious solution was a character mode. Matter of fact it still kind of bugs me! The only program I wrote back then that I really miss were a combination character set and playfield editor that did the gr. 15 to 12 conversion. I even contacted a friend from the bbs days to see if he still had a copy of its download section.

Rick

Nah, not really. :) I just invented that 'Super IRG' flickery mode
for one of my games. A fellow named Bobby has since gone and
invented a bunch of related modes, and is making a fancy new editor.

(Closest thing I can find to a reference is this text file
hosted at AtariAge. I'll leave it as an exercise to someone
with more patience with web forums to figure out what actually
links to this:

These days there seem to be a number of applications (mostly
MS Windows ones?) that can convert a graphic into a set of
character sets and the character data. Many demoscene visuals
seem to utilize charactersets to do some of the animated screens
(versus using bitmapped modes).

One that comes to mind is a funky text scroller by Hard Software,
where it's obvious that they way they got three scrollers on the
screen next to each other was by simply blitting the scrolling
text into the font. The actual data on the screen is static
(just a matrix of characters, repeated three times).

Now you've been doing the linux thing you really know
what a programming environment is. Let me preface
this with I don't like 'integrated development environments'
I like to roll my own. Even when I was mostly on my
Atari I usually had my SDX cart plugged in with Action!
on top and an asm/edit ROM replacing the built in BASIC
so I could go back and forth. I like using a multi tasking
computer just so I can have an editor open, a compiler, and
an emulator. Nothing like a robust programming environment
where if one thing crashes you just have to close a window.
Problem is I have tried some of the utilities and they don't
work the way I like to work. They work better then the
originals but they don't work the way I want to.

I used to make my character sets with bbkart and import
them directly into my conversion program that worked as
a play field editor. I could write out screens and character
sets from there as either screen data or strings to be used
in my programs. It was bone head simple: Just skip the
first 4x8 corner of the micro illustrator pic so you would
have a 'space' character then draw on the top ~24 lines.
I'll keep poking around and see if I have anything I made
with that set up.

I suck at art and music. I am pretty good at using what
is available.

Anyway, if you remember that Action! demo 'Pretty'
the color scrolling works in character modes. Lot of
overhead but each pixel of a gr. 12 character could
have ~4 pixel wide in four colors by 8 pixels high with
8 colors per each horizontal line, sort of like Rambrant
with one extra color. I'll see if I can knock something
out to show you what I mean. Downloading a Sea
Monkey update on dial up so I may just take a nap
instead!

Here's a quick and dirty program I wrote to slop some colors up. It
works with the emulator. You have to press reset<F5 in Atari800win> to
get back out. I couldn't think of a good way to change colors smoothly
so I just loaded the vert count, stored it in first color reg, shifted
it left, stored it in the next color reg, et cetera.
Anyway, mucho colors. I left them static, vs. rainbow, on purpose so
you could get a look at them. If I resurect a dungeon diving program I
wrote I may do something like this except shading like Dungeon Master.
Not much hope for that at the momment, this getting back into
programming is knocking the stuffing out of me.

```

Very unusual. I'm not familiar with graphics 12, seems be character
mode.
It didn't go to attract in my emulator.
I had problems saving/listing to MyDOS. Worked SpartaDOS 3.3A.

Guh? Never seen IRG text? :) There's also GRAPHICS 13, which is
double-height (so it gives you 40x12 characters, where their
pixels look like GRAPHICS 7 mode: 160x96. GRAPHICS 12 is 40x24
characters, just liek GRAPHICS 0 mode, but the pixels look like
GRAPHICS 15 mode: 160x192).

Pretty much what you use when you want multicolored tiled graphics.
(For single-colored, which I did a lot as a kid before I coded up
a reasonable multicolor font editor, one typically uses GRAPHICS 1
or 2, the 20x24 and 20x12 text modes. Those end up looking very
Commodore VIC-20'ish :))

> It didn't go to attract in my emulator.

I don't understand Rick's ML, but it's either a Display List Interrupt,
or acting a lot like one (alterting color registers in GTIA each
scanline). So Attract Mode wouldn't affect it, since the colors
that the OS's attract routines come up with would getting
overridden by the raw writes into GTIA.

Right, alternate color each scanline, I guess:

```
$600 PLA
$601 LDA $D40B VCOUNT
$604 STA $340A WSYNC
$607 STA $D016 COLPF0
$60A ASL A
$60B STA $DO17 COLPF1
$60E ASL A
$60F STA $D018 COLPF2
$612 ASL A
$613 STA $D019 COLPF3
$616 ASL A
$617 STA $D01A COLBK
$61A JMP $0601
```

I've seen this for the amiga, but it was a XXX thing that used the
joystick.

I suck at emulator<grin>. Really it is taking me forever to come back
up to speed. I think I do like the emulator for the access to the hard
drive as the H: device. Tourturous path but I've been working on a:
Dungeon Master clone on Windows screen shots to conversion to BMP to
Atari. All I do is save the BMP to the emulator directory and I can
read it direcly i.e. OPEN #3,4,0,"H:PIC133.BMP"
I posted a progress so far picture
http://www.ataricorpse.com/index.php?topic=10.0

I think I know exactly what I did wrong. IBM uses a color pallet so if
you have colors close together I am dropping them with too simple of
an import. Something like a picture in 15 shades of gray and one white
reduced to two colors.

I was always disappointed more articles weren't written on GR.12. A
little data in some of the hardware books that left it to you to find
out how its done. I think most of the good games like Frogger used it
for all the advantages it gives you with reduced memory requirements
and extra color. A simple to use tool is on my todo list.

Rick

3792. Announcement: cc65 version 2.13.2 is available

Newsgroup: comp.sys.atari.8bit
Date: 2010-03-07 13:21:49 UTC
From: uz@spamtrap.musoftware.de
Message-ID: <hn099d$r95$1@moppi.musoftware.de>
Source record: 1531
Cross-posted to: comp.sys.cbm,comp.sys.apple2.programmer,comp.sys.atari.8bit,comp.sys.oric

I'm proud to announce version 2.13.2 of cc65. cc65 is a complete cross development package for 65(C)02 systems, including a powerful macro assembler, a C compiler, linker, librarian and several other tools.

cc65 has C and runtime library support for many of the old 6502 machines, including

- the following Commodore machines:

VIC20
C16/C116 and Plus/4
C64
C128
CBM 510 (aka P500)
the 600/700 family
newer PET machines (not 2001).

- the Apple][and successors.

- the Atari 8 bit machines.

- GEOS for the C64 and C128.

- the Nintendo Entertainment System (NES).

- the Supervision console.

- the Oric Atmos.

- the Lynx Console.

The libraries are fairly portable, so creating a version for other 6502s shouldn't be too much work.

This version is a bugfix release against 2.13.1. Changes have been made in the following areas:

* Some error corrections in the docs.

* Added a document that describes how to use the cc65 toolset with a currently unsupported hardware platform. Constributed by Bruce Reidenbach.

* Fixed crlf->lf conversion problem in .INCBIN (ca65).

* Fixed problems with 80 column mode (C128).

* Added C64 mouse driver patches by Greg King to remove "crosstalk" between mouse and keyboard.

* Fixes for the ptvjoy drivers (C64, C128, VIC20) by Marco van den Heuvel.

* Fixed an optimizer problem (cc65).

* Use the drive from which the program was started as default for all
following file ops (Commodore machines). Patch by Oliver Schmidt.

Precompiled binaries are available for the most common platforms. On many
other host platforms, the sources compile out of the box, so you'll able to
create your own binaries.

For RedHat Enterprise Linux 5, ready made RPM packages are available. These
packages may also work on other rpm-based Linux systems. Please note that
there are separate RPMs for the compiler proper, the docs, and the target
specific libraries. To develop code for one of the target machines, you need
the compiler RPM package *and* one of the target machine packages. Be sure to
download the documentation package if you're new to cc65.

For windows users, there's a user friendly installer package (the one with the
.exe extension). All subpackages are selectable from within the installer
dialogue. The installer will also setup the necessary environment variables
and start menu entries. It is recommended that Windows users choose this
package instead of the .ZIP files.

Precompiled binaries for DOS, OS/2 and Windows are available in ZIP archives.
As with the RPM packages, you need the package for the development host system
(Windows or whatever) *and* one or more of the target machine packages, plus
optionally the doc package.

All packages are available from the MU software FTP server:

ftp://ftp.musoftware.de/pub/uz/cc65/

More information on cc65 can be found on the cc65 web page at

http://www.cc65.org/

There is also a mailing list for discussing cc65 related issues (programming,
suggestions, bugs, ...). See

http://www.cc65.org/#List

for information on how to subscribe to this list.

While I'm the main developer of cc65, it is actually a joint effort. I would
like to thank the target library developers, all the people on the cc65
mailing list, all those sending suggestions and feedback, and even those
bugging me for a new stable release:-) The CREDITS file is probably
incomplete, but you know who you are.

Thank you!

Uz

Posting-Frequency: 10 days
Last-modified: November 16, 2009

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

I don't know if you care or want an explaination or if I can give one w/o a mistake or two, doing this on the fly. I guess the information is the reason for the newsgroups existance is probably good'nuff for me to go off.

One of the best explainations I ever heard about assembly language programming on a 6502 is that it is just like BASIC except you only have 3 variables, [A, X, Y] and 64k memory locations. Actually you have a hardware stack too! The nemonics translate directly into higher level languages that we are all familiar with.

$600 PLA
=> Pull A variable from the stack.
It is done in hardware vs. software stack so indexing is automatic. It is a shared stack that is used by both hardware and software so it is easy to corrupt it. This won't actually run but just using it for an example.
BASIC equivalent of stack would be something like

```
;
10 STACK=1791;top of page 6
;1st bit of info to pass the #60 and move stack pointer down
30 POKE STACK, 60:STACK=STACK-1
;2nd bit of info, can't POKE more then 255 so convert to 2 bytes
40 POKE STACK,0:STACK-1;low byte
50 POKE STACK,6:STACK-1;high byte
60 GOTO 1000
70 REM YADA YADA YADA continuation of program

;Since we put 1536 on the stack this would execute a ML routine on
page 6
1000 A=USR(PEEK(STACK)*256+PEEK(STACK+1)):STACK=STACK+2
;Load return address into variable A REM we only have A, X, Y
1010 A=PEEK(STACK):STACK=STACK+1:GOTO A
```

So with a stack your program becomes a little longer with the pushing and pulling stuff from the stack but in the example we only used a page of memory and a single working variable A to do stuff. In a

6502 registers are silicon real estate so you can't have thousands.
Long explaination for the PLA which is just here because BASIC puts
the number of arguments on the stack which in this case is #0!

$601 LDA $D40B VCOUNT; same as A=PEEK($D40B) VCOUNT is just the screen
line being drawn divided by 2 I think, so for a 225 scan line NTSC it
goes to ~130, accurate info in 'Mapping' I don't care about anything
for this other then it changes!
$604 STA $D40A WSYNC; same as POKE $D40A, A so color changes don't
occur in the middle of a line
$607 STA $D016 COLPF0; POKE COLPF0, A
$60A ASL A; A=A*2 actually a shift operation but *2 is the result
$60B STA $DO17 COLPF1; POKE $D017, A
$60E ASL A; A=A*2
$60F STA $D018 COLPF2; POKE $D018,A
$612 ASL A; A=A*2
$613 STA $D019 COLPF3; POKE $D019, A
$616 ASL A; A=A*2
$617 STA $D01A COLBK; POKE $D01A, A
$61A JMP $0601; GOTO $601

As far as interrupts go I didn't use them for reasons that can be
explained. First I am using graphics 12 which is a character mode so
the display list where you would normally do a DLI is only 24 mode
lines of visible screen. You can only do one DLI for every 8 scan
lines/character. Its all good, I mean I could have changed the 5
colors 24 times but then I would need a different display list and
register saving during the interrupt so really a PIA for just
something I wanted to demo the number of colors available *AND* have
them change on every scan line w/o flicker. We are used to graphics 0
being a on/off or high/low lum mode but change the line 50 to GRAPHICS
0 if you want to see something a bit unfamiliar! You get graphics 0 in
multi color mode.

Thinking about it, it's almost the opposite of interrupt code. I mean
if I wanted to do something useful or entertaining I would transfer
the control of the little code snippet to run something during the VBI
while I am not busy with the screen. The useful part would have to
finish before the screen started refreshing and so it could return
control to the hardware color register stuffing part.

Kind of academic but I think you could load the index registers with
fixed memory points so you could have the equivalent of ~130 color
registers available on a scan line basis. The equivalent of RAMBRANT
but instead of memory hungry modes like graphics 15 or 8 you could use
the character modes.

Rick

If you change line 50 to GRAPHICS 8, then it makes the nice static
rainbow.

If you change the ML program to

*=$600
pla
loop
lda $d40b
bmi inkey; bails when $d40b>128
sta $d40a
sta $d016
asl a
sta $d017
asl a
sta $d018
asl a
sta $d019
asl a
sta $d01a
jmp loop
inkey
lda 764
cmp #$FF
beq loop
lda #$FF
sta 764
rts
.end

You can return gracefully to BASIC with "Press any key".

BTW: I am using a version of TASM from ~199x. I probably should 1) get
current version and pay shareware fees or 2) start using a freeware
assembler. I think the currently available version of TASM would work
but I haven't tried it.

Feels good to get some of the old brain cells firing again. I'm so
rusty I can't do decimal to hex conversion in my head anymore, i.e.
sta 764, and had to look up the BMI instruction to make sure it does
what I thought it did.
```

I'm having trouble with it. It seems to me $D40B never goes
negative. It returns the line divided by two,
which would be a max of 127. I put it into the BASIC program and it
doesn't work for me.
Can't get it to work in ASMED either. Uhmm.. My ML for beginners
says never use BMI,
use BCC or BCS instead, don't get that either.

I got it to work like this:

```
10 *=$600
20 PLA
30 LOOP
32 LDA $2FC
34 CMP #$FF
36 BEQ INKEY
40 LDA $D40B
60 STA $D40A
70 STA $D016
80 ASL A
90 STA $D017
0100 ASL A
0110 STA $D018
0120 ASL A
0130 STA $D019
0140 ASL A
0150 STA $DO1A
0160 JMP LOOP
0170 INKEY
0210 LDA #$FF
0220 STA $2FC
0230 RTS
0240 END
```

And in BASIC.

```
20 FOR N=0 TO 41:READ PROG
30 POKE 1536+N,PROG
40 NEXT N
50 GRAPHICS 8
52 GOTO 90
60 MSC=PEEK(88)+256*PEEK(89)
70 FOR N=0 TO 959:POKE MSC+N,N/4
80 NEXT N
90 X=USR(1536)
91 GRAPHICS 0:? "DONE"
92 DATA 104,173,252,2,201,255,208,28
100 DATA 173,11,212,141,10,212
105 DATA 141,22,208,10
110 DATA 141,23,208,10,141,24,208,10
120 DATA 141,25,208,10,141,26,208
130 DATA 76,1,6,169,255,141,252,2,96
```

Source record: 1543

Just another rambling message about how the mighty have fallen. I used to really be into 1050s by chance. When Atari was going belly up one of the local electronic surplus outfits had pallets of busted 1050 drives that I assume were returns that Atari never got around to fixing for less then $20, I can't remember the price but cheap, I ended up buying a trunk load, fixing them, and selling them for $20 including shipping. Ah for the good old days when everyone didn't have their hand out looking for you to cross it with a couple of hundred bucks.

Anyway just went to Halted for a walk through, first time in probably 10+ years. Time marches on, they had a rack with boxes of old ICs in anti static tubes. I starts looking through them, 256k and 512k EPROMs, I says to myself "I guess everyone got rid of their UV eraser now that Flash has taken over" I see Dallas clock chips in old style socket, then I come across a tube of 2797 FDC chips. I got confused for a momment, I was thinking back to what they used to sell for and it was like seeing a couple of hundred dollar bills in a cardboard box. Historical note: The 2797/2993 were the FDC used in the 1050 and maybe Rana drives.

Then reality kicked in. I still have a couple of 810s and maybe 4-6 1050s in various states from bone stock to USD. I did hook up my ATR8000 but I have lost interest in things 810 and 1050 other then historical value, one of my 810s is a low serial number 2 board design and the other is an "810 on a plate" so they both stay of course. Likewise I am not interested in getting rid of my 1050s. The point being that I am mostly moved on to other ways of doing it. I have a 720k 3.5" and 1 or two quad density<720k> 5.25" disks attached to my ATR8000.

I still think about an alternative universe kind of things Atari. I think the 2797 supported double sided and I'm pretty sure ~76 tracks for the old DSDD 8" drives. If I have history correct the 1050 wasn't an in house project. In house was the 815 which Atari couldn't get right so Tandon came to the rescue with the 1050 design. It would have never happened because of backwards compatibility issues but the 1050 should have been double sided right out of the starting gate with ability to handle 1 meg formats. The old 1.2 meg 5.25" drives were made to be compatible with the 8" drives so we would have had a plug in 1 meg storage upgrade path.

FWIW: As you may know this came out really late in the 8-bit product cycle, circa 1989 and was 130XE only if I have it right. I can't remember the price but I figured B&C may still have a copy so I shot them off an email. There's a real good chance there were only a couple of copies sold and those were lost.

If B&C comes through and doesn't ask for a small fortune I'll buy a copy and see if I can track the author to find his current thoughts about making it PD or Freeware.

Hello Rick:

I do have a copy of KYAN Pascal if you are looking for it ? I tried
using it but went back to BASIC for anything I could
understand.

Thanks for the offer but I am a bit to old to move to a different
programming environment then I know now. Too many dead brain cells me
thinks.<grin>

I mostly use Action! if I want structured and assembly if I need
speed with a little bit of BASIC mixed in. I even gave up some of the
good ones like C. Heck, I am still using 'EDIT' from the command
prompt of XP for my assembly language programming editor.

Retrojess has the accurate description for when it bails. Thanks for the conversion to 764=$2FC, I used to have two or three programming calculators just for doing that type of thing and binary. I should get one again. The negative is the signed binary math thing. For example in 4 byte integers instead of just representing the numbers 0-4 billion they use the first bit of the number as sign bit so the range is -2 billion to +2 billion. Kind of weak on the topic but for floating point they further divide up the bytes to use some bits for powers of 10 for example. IIRC Wilkinson used 5 bytes for our computers which makes them fairly accurate compared to other computers, they all used 4. Anyway the scheme can be just about anything you chose like first bit sign for the first 3 bytes and the last byte a signed power of 10 to keep it simple for my simple mind, a 2 byte scheme. I'm sure there are more mistakes here but 4am...

First byte is 0 127 means 0 to 127. 128-255 means -1 to -127
Second byte is signed but powers of 10: 10^1 to 10^127 and 10^-1 and 10^-128

So if you had two bytes together 12 and 4 it would be 12X10^4 or 120000
Likewise if you had 141 and 129 it would be -13X10^-1 or -1.3
So just using 2 bytes you could do numbers as big as 127X10^127 and a small as -128X10^-128. Whew that makes my head hurt! Good enough to go from atomic level to light years with 1 part in 127 accuracy.

RE: Rainbow scroll, how many registers do you want to do? Kind of a cute exercise on a couple of levels. For DLI's we have all the waits for the interrupts<7 cycles or something per> but if we just bang on

the color registers there is time to do some serious stuffing. In general I think it is a good idea to have some routines like this that can be called from BASIC. Much less 'black box' and available then the 'demo' stuff. I'll knock something out today if I get a chance.

Rick

3810. Pretty Basic

This is not optimized; stored variables at start of page 6, didn't use faster page zero or 6502 registers much, it just works. It should show something for every<gr.0-15> mode since it is tied to scan lines and doesn't care squat about the screen mode or DLIs. Only rolled 2 color registers in this but figured I should produce something for now. Interface to BASIC is about as good as it gets, goes to and turns control back to BASIC i.e. "DEMO DONE." Some modes may only have borders scrolls but I don't know for sure. If it is to much of a memory hog, ~1/2 of page 6, it could be installed and programs chained or stored in a string and poked from there. Normal restrictions apply in that any I/O in BASIC >128 bytes(?) will stomp bottom of page 6 and take the code with it, MAC/65 and DDT trash page 6 too so you have to use a monitor like Omnimon or an emulator to look at the code in situ. It may take me a bit to get the .ASM file posted. Things to do, people to see, social butterfly, that is me!

```

It was stressful, I forgot my 2600 & 7800 cartridges,
I wore a hole in one of my socks, and I'm sore all over.
...but overall, this year's Atari Party was GREAT!

Check out the photos:

http://www.newbreedsoftware.com/atariparty/2010/photos/

As people give me permission to, I'll be adding more photos,
so if you're really curious about it, check back again in
a week or so.

Enjoy!

Thanks for posting that Russ. Seeing in black and white helped it
register.
Just had to correct myself
*=$610
JMP $0613 ;should not be here! bonehead on SOOOO many levels.
;DOS jsr to first byte but that would have been the
;the byte at $600 the way I wrote the original and I
;used TASM which doesn't add DOS binary file headers
;automatically so you couldn't use DOS anyway and...
;the list goes on
;I added the *=$610 to save face but originally
;there was reserved space which would have fooled DOS
anyway
start
LDY #$01 ;target of X=USR(1555) $613=1555 if the useless code is
removed
;target becomes $610=1552

yada yada yada rest is OK but all the variables should be page zero
for speed. For calling from BASIC you can use the all the FP register
space on page zero since they are safe during a usr call.

*AND* most importantly with the space saved by dropping that useless
code at the start and using page zero memory you could put it on the
bottom of page 1! I have watched the stack pointer and it never drops
lower then ~14 bytes. I even wrote one program that passed something
like 40 parameters via a USR call just to see if the stack could
handle it and no problems. I think there are only a handful of coders
that use it so the only things that would crash it wouldn't normally
be used at the same time. Maybe a debugger or cassette copy program.

If it gets moved to the bottom of stack i.e. *=$100 and variables get
moved to page zero i.e. STY $D4 vs. STY $600. The code goes Steve
Austin: faster, stronger, better.

Kind of busy for the next day or three but I may revisit this.

Rick

Back in 1996 I put together a little "Star Raiders" tribute
web page (which currently lives here:
http://www.sonic.net/~nbs/star-raiders/)

Thanks to that, a kind fellow emailed me yesterday to ask
me if I knew about Doug Neubauer's website, where he has
posted some trivia about Star Raiders (did you know
"What's Wrong?" was a nod to THX-1138?), and stories about
designing POKEY, working at Atari, and other topics.

I hadn't seen it mentioned before (that I can recall),
so happily added links to his articles from my SR page,
and figured I'd share the links here, too! :)

http://dougneubauer.com/starraiders/
http://dougneubauer.com/ataripokey/
http://dougneubauer.com/atari/
http://dougneubauer.com/atarisolarismanual/

Enjoy!

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

A new emulator for Atari xl/xe:

http://www.virtualdub.org/altirra.html

A new SIO2PC/APE Front end for holding atr's:

http://sourceforge.net/projects/aspeqt/

Two really good fairly new projects for the Atari Hobbyist.

Regards,

RoyE

3822. Nordic Atari Show 2010: June 11-13

Newsgroup: comp.sys.atari.8bit
Date: 2010-03-20 16:42:03 UTC

Friends!

I'm proud to announce the 2010 edition of the Nordic Atari Show (NAS)!
The event takes place June 11-13 in Falköping, Sweden (about an hour
from Gothenburg by train).

NAS is an annual get-together organized by the Swedish Atari Club
(SAK). It's a simple, improvised event; the idea is to hang out, eat
pizza, and fool around with our beloved Atari machines. The essence of
NAS is its visitors and what they choose to do with it.

Traditionally NAS is an Atari event, but other (retro) platforms are
welcome as well. However, if you're 14 years old and wish to play
Counter Strike with your friends, please go somewhere else

For more information, take a trip to: http://www.sak.nu/index.php?ucat=15&sta
... index=true

Source record: 1562

Trying to keep score. Still haven't got my Needem PB10 EPROM programmer running. I did find some software that runs under DOS. Kind of academic since my custom OS and a bunch of other stuff was all on hard drives that went for a swim. Still, it will give me a chance to do some of the stuff that makes life a little easier like burn an EPROM with fast floating points routines, change left margin start up to zero, change default colors, maybe burn another OMNIMON if the ones in my 800xl and 1200xl are gone baby gone.

I've spent maybe 100 hours trying to get a copy of my playfield/FONT editor off a busted hard drive to work. Today I was putting some stuff away in a dresser and of all things I find a 3.5" floppy case about the size of a pack of cigarettes in the under some sweat pants! The label on one disk said it had SCREDIT on it. I didn't want to risk that disk so I stuck one in my 3.5" equiped ATR8000. I forgot how much clicking and grinding SDX does with an ATR8000. NAKs, groans, click head load, click head load, NAK, groans, then it starts chugging. Hey great! A directory and I recognize some of the files. One was a load and go graphic demo I wrote for a friend with kids. I give it a go and after the start up grunts it loads two sectors<24k file!> and bails out with an error. No big deal because all the files I need to rebuild it are still there. I pull the disk out, slide the window back, and see a huge gash on the top side of the disk. The disk is labels 360k but I don't know how I arrived at that. I may have done it as a double sided 40 track drive or single sided 80 track drive. Glad I didn't put in the disk with SCREDIT in it.

80:20 it was scratched by crud:the media had turned to powder. If the media has gone it would have scored top and bottom. I took the drive appart and it looked like it had more dust bunnies inside it then a bed has under it. I cleaned the heads with IPA but it is going to take some serious dust busting.

I bought a new copy of Digital Research DOS off eBay. I was thinking try 22disk, anadisk, and DEANA. Turns out Sydex has changed hands and they have been pulled from the PD. $100 now. IIRC DEANA was Preston Crow's but the status of the Sydex products kind of pulls the rug out from under it. The only good thing about that pursuit was I found ref for a Samsung drive that will emulate an 8" drive.
http://www.techtravels.org/amiga/SAMSUNG-SFD321B-070103.pdf
Not a huge thing but MyDOS and ATR8000 support 77 track DSDD 8" drives so it could move me from 720k to 1 meg. Taking inventory on my ATR8000 drives I think I have 1 360k DSDD 5.25" disk as drive one so I could boot protected software, 720k 3.5", a QDDD 720k 5.25" <got that one out of a Televideo or something>, and something that constantly causes

me grief, a 360k/720k switchable 5.25" disk. QD are just 80 track 5.25" drives but they have narrower heads. The one I modified just made it double step so it looks like a 40 track drive to software. Problem is I keep forgeting the switch settings and writing a real 360k drive floppy in a narrow head QD drive. I screws up the disks on a pretty regular basis that way. I really have to stop using magnetic media. Bought myself a bargan bin 512 meg SD card. Looking at the specs I would say it could be driven from a joystick port like the old Corvus HDs. It would be about $145 cheaper the the other solutions but I don't know when I will find the time to work on it. Maybe if I didn't make all these long winded posts!

On that first disk I scarred I saw I had one of my gr15 to gr12 converters on it. I also had a program that would try to fit a gr15 screen into a single FONT. It would wade through the screen from top to bottom seeing if it had already defined a character if not it would add a new one. I'd like to retrieve that too as I had a Mickey Mouse graphics 0 character set that with artifacting was most excellent IMNSHO.

Past midnight, tired from going to the beach to spend some time with two of my grand daughters today. Life is good. 'night all.

Rick

Mydos and SpartaDOS format 128/256 bytes per sector.. I notice ASPE QT or
Altirra offers 512 bytes formatted disk. So what DOS can format 512 bytes ?

```

I see you're busy. Please check your e-mail, I guess the one used
here is a spam bucket.
The numbers (06XX) just come from DEBUGPL but edited to remove hex
numbers.

This is neat! Could you make one that can be ran from basic and not exit
back to DOS..
I compiled and ran this with MyDOS using basic to load xio 40, etc.. but it
dumps me back to dos. I would like to try it out with Turbo basic also..

I would like to convert all my old 5 1/2" disks to disk images that I can use with an emulator on my Mac. I still have my old 5 1/2" Atari disk drive, and I'm wondering if I can buy an adaptor so I can connect it to a USB port.

Years ago, I bought such an adaptor, but it was for some kind of archaic PC port that you could only find on really old PC's. I no longer have access to such a PC, and I was hoping that instead of trying to find an old PC, I could find an adaptor that goes to USB (along with some Mac software to make the images)

Thanks,
-Jeremy

If you don't take James up on his generous offer, can you tell exactly what equipment your current PC is has? It sounds to me like you either had and old Xformer printer cable or an SIO2PC type device and no longer have a PC with serial ports.

IF you have a PC with serial ports and a working 8 bit system you can use a SIO2PC or APE. Building one yourself is cheap, <$6 if you have a spare Atari Cable or build it inside your computer.

If you just have a 1050 w/o a working 8 bit then you have to use something like an APE Prosystem cable.

The latest incarnations use USB vs. RS232. This option if you don't have serial ports on your PC and want to do it yourself is probably best. They cost ~$40 on eBay but work in every mode you could need.

I did not know this, but I guess I shouldn't be surprised. I'm
finally 'without serial ports' (well, except my wife's older laptop
I suppose), but I'm also SIO2SD-enabled, so in terms of _booting_
my Ataris, I've got an excellent (and portable) solution.

In terms of backing up my disks, I need to go 1050 -> Atari -> SIO2SD,
which is honestly kind of a pain. I'd love to be able to just
hook my 1050 up to my Linux laptop and hit "go" to back it all up.
Meh. :^(

Jeremy,
Slor's offer would be the cheapest and probably best.
I bet that many of your 5 1/2" floppies are copy protected, which
makes copying harder, near impossible.
Bill Kendrick is probably most familiar with non-PC software and
adapters, but I'm pretty sure
there is no Atari to MAC interface like we have for PCs, the archaic
serial port ones, there are (again for PC)
USB adapters and software now.
There is one thing that you can do with your Mac, and I'm not sure how
good it is, is the 'Rainbow' Atari
emulator for the Mac. It is old, but I think there's a OS X version.
http://www.bannister.org/software/rainbow.htm
If 'Rainbow' is like PC Atari8 emulators, the .ATR disk images will
work to run the games on the Mac.
I don't know a Mac person that is into Atari8 options.
You'd need to be familiar with the Atari8 in order to use .ATRs.

For Mac to Atari emulation
Try this link:

http://www.atarimac.com/sio2osx.php

other info on this page tells about the requirement for a special USB to
SERIAL dongle for use with the SIO2PC USB cable at www.atarimax.com .

Registration seems to be required to use atarimac osx software for longer
periods..

I'm guessing Atari800 should also work fine on Mac (since it has a
libSDL target, and SDL is well-supported on OS X).

Does your laptop have a PCMCIA/Cardbus or an ExpressCard slot?
If yes, you could buy a 16550 (or even better a 16C950) card for
some 15-30 USD and use your old serial SIO2PC and/or 1050-2-PC
interfaces.

> I'd love to be able to just
> hook my 1050 up to my Linux laptop and hit "go" to back it all up.

Last year I enhanced AtariSIO so that atarixfer supports several
highspeed SIO modes (yes, I also had to transfer a batch of disks
from my 1050 to my Linux box :-). A standard 16550 card supports
Happy Warp and XF551 2xSIO, with a 16C950 card atarixfer also runs
with Happy Ultra Speed, 1050 Speedy and 1050 Turbo at approx. 3xSIO.

ATM it looks like AtariSIO will stay serial port only for quite a while.
AspeQt also works fine with FTDI based USB-RS232 adapters, but
currently AspeQt is still missing support for 1050-2-PC interfaces.
But, just drop the author of AspeQt a line, maybe he'll add support
for 1050-2-PC :-)

so long,

Hias

Hias, Did you ever get the Indus GT hi-speed mode working? You and I exchanged some e-mail about it last year. I never did have any luck.

FYI: There's a new gadget available called an 'FDC-5025' that adapts a PC high-density 5.25" drive to USB. The board carries a little microcontroller that directly interprets flux transitions like a poor-man's Catweasel. He makes the API available if you want to add formats. It's read-only at the present time and can handle standard Atari 1050, Apple 2, Commodore 64, TI-99 and Northstar hard-sectored formats out of the box. Software sources supplied and can target Windows, Linux (even my 64-bit system) and MacOSX.

http://www.deviceside.com/fc5025.html

I've found it very handy.

Steve

Yes, I remember. But so far I haven't been able to get access to an Indus
drive to do some tests by myself. If those damned drives would be a little
bit cheaper you could be sure I'd already own one :-)

I'll keep trying to get access to one (at least for some time), and I
hope I can do the tests and finish the work.

Thanks to everyone for your replies. Steve, the device you mentioned looks like exactly what I need. I can use this to connect my Atari disk drive to my Mac and make .atr images from my disks, right? I went to the page and it looks like it's what I need, though I couldn't find any pricing info, or how to buy it.

To answer some of your questions: My disks are not copy protected. These are disks of files I made myself: programs written in Basic, and word processor files mostly. I have the 5 1/2" disk drive that came with my atari 800XL, but not the actual computer. And I do have an SIO2PC cable that I bought years ago, and I was able to use this to convert some of my old disks on my friend's PC. But I don't have access to that computer anymore, and newer PC's don't seem to have that kind of port. And anyway, I only own a Mac. I have heard that now there are SIO2PC cables that are USB, but the software is only for PC. But I was thinking that I could use VirtualPC, since it's usually pretty good about USB port emulation.

But anyway, it seems like the device Steve mentioned would be better, and I wouldn't need to use Virtual PC. Now I just need to figure out how to buy it...

Thanks again,
-Jeremy

I haven't yet, but I have done Apple II disks. Works great.

If I can get into my Atari stuff, then I can try one. I have my
FC5025 set up and running. Just a matter of pulling out a disk.

End quote.

I think you can't hook your 1050 to the device. It is for a PC type
5.25" drive, and you have to supply
the power to the drive yourself, like from a removed PC power supply.
So, you'd have to buy
a 5.25" PC drive, the adapter.
The device will read your disks OK, just there's no way to connect
your 1050 to it.

I'm a bit confused. You plug it into an old PC 5.25" drive (via the ribbon
cable), or what? (I'm imagining old-drive --ribbon--> device --usb--> PC)

Has anyone got photos of it actually plugged into a disk drive?
Man, where does one GET old 5.25" PC drives? (I've _never_ owned one.
My first PC was a PS/2 with a 720K 3.5" drive.)

I still have more then a few real 5.25" laying around but most are in goofy stuff like an external 2 floppy drive housing with the old 37 pin cable, a CP/M computer built into something about the same size, and a H89. The H89 used hard sectored disk so it probably isn't a good candidate for a donor.

For that matter I found a couple of 8" drives in my attic. Two<?> are still in a ~DEC PDT/11. I think people must be using them for Volkswagon turbo chargers or something since they seem to be selling for multiples of $100s. Fifteen years ago I left off at building a cable ATR8000 => 8" drive but didn't get to finish. All I had left to do was build a 24V power supply for the stepper<???> when I got in a relationship! Damn women.<grin>

Too old and too late methinks. I've been doing alot of reading trying to come back up to speed so I end up doing a lot of "could'a should'a would'a" Read where a guy trashed five Atari 520ST just because he wanted the 1772 FDC chip. I still fight the urge to bit bang a FDC on the Atari buss. IIRC all of our data is inverted so you can't just hook up a FDC in the memory map unless you want a one of a kind that's incompatible with everything else. I think I will crawl around the attic some more tonight.

Rick

Jack, if you mean Atari 8 bit then one would be the Floppy Board from
Bob Puff. There were also a programs to transfer files MS DOS 512 byte/
sector files on a 1050 Happy drive and a modified XF551. I'm not
familiar with all the after market drives out of Europe but it
wouldn't suprise me if there were a few more. I don't think there was
a DOS at the time that supported them in 512 byte sector mode.

The WD1772 was used in the ST with 512 byte sectors and in the XF551
with 256 byte sectors. It is more of a software problem then chips.

Rick

I notice that software mentioned at thelink specifies 'Atari 810'.
Where does that leave Dos 2.5/3.0 1050 enhanced density and
disks made on any of various true double density hardware?
-Jess

I believe the 810 mentioned just means that the device, hooked up to a
PC 5.25" floppy and powered, would
be able to read the single density floppies, you don't hook a 810 up
to the device.
I believe there would be a problem with the device reading Atari
single density, many PC floppy drives
are dbl. and high density. I don't think the device would be able to
read single density Atari disks, which
is the whole point of what is being tried done here.
Also, the original poster is thinking of using a virtual PC on his
Mac, and a USB to SIO/1050 adapter, like
AtariMax sells. I don't think that will work either, as in PC land,
it would need a proper driver to
do the job and I don't think the AtariMax APE software, or Pro
software, works with a 1050 to PC
device, as the OP wants to just hook his 1050 up to his Mac and read
in the files to .ATRs.
Don't think it will work.
I still think James' offer to read the disks and put the files on a SD
card would achieve the desired.
Of course, there may be privacy concerns. A USB flash drive might be
better.

That is correct.

That is not correct. Issues with single-density 'FM' recording mostly stem from the clone floppy controller chips on PeeCee motherboards. The FDC-5025 adapter uses an Atmel microcontroller to directly extract flux transitions from the disk. It neither knows nor cares about single-density vs. double-density vs. high-density. The limiting factor is sample rate, and the unit is capable of reading "modern" HD 1.2M diskettes - lower (e.g. ATR 810) is not an issue and it does just fine with them.

Steve

It leaves you writing your own driver :-). The API specs are shipped on a CD with the product. I have not delved into it very deeply, but it appears to be orders-of-magnitude simpler than writing Catweasel drivers (not for the faint-of-heart).

Packrats like me have drawers full of them. Otherwise, try eBay or a local
hamfest. Since everyone has gone nuts with Reduce, Re-use, Recycle, hundreds
of thousands of these have disappeared into the crusher or, more likely, scrap
heaps in rural China. Blink and it's obsolete!

A photo is not very interesting, although I have mine mounted in the case from
a mid-90s Apple CD-300e CD-ROM drive. Same form-factor.

Okay, I'm getting a lot of different info here, which I very much appreciate, but I'm a little overwhelmed. So let me just get this straight: If I buy the "FC5025 USB 5.25 floppy controller" that Steve mentioned, and I buy a PC floppy drive, then will I or won't I be able to convert my Atari 800XL disks on my Mac?

It looks like there's some dissent here, so maybe I'll try asking the seller of the item.

Thanks again,
-Jeremy

You will be able to convert "standard" single-density Atari diskettes on your Mac. Best to look for the recommended Teac disk drive he mentions on the product website. Some basic familiarity with computer hardware is assumed, to the extent that you'll need to locate and possibly change a few jumper settings on the floppy drive. You will also need to arrange for power to the drive and a safe means to have everything hooked up and usable without shorting the USB adapter against anything else (it's just a bare circuit board).

If you're not comfortable with any of that, you may want to look at other solutions.

> It looks like there's some dissent here, so maybe I'll try asking the
> seller of the item.

I own one of these. It works. I can read Atari 810 format diskettes (90kB) with it. You cannot read the newer double-density (actually sort of 1.5 density diskettes) unless you want to write your own driver. I'm sure Adam (the designer) will confirm all this if you drop him a note.

The Mac OSX software is provided on the CD-ROM, but I have not used it since I spend all my time on a Linux platform.

Something like this, right?

http://www.overstock.com/Electronics/StarTech.com-1-port-16C950-UART-ExpressCard-34-Serial
-Adapter/4240815/product.html

(It's $55 USD at that site, at least)

> > I'd love to be able to just

> with Happy Ultra Speed, 1050 Speedy and 1050 Turbo at approx. 3xSIO.

Cool.

I'm not sure, though, is it worth it for me to spend $55 on a device
that lets me do SIO2PC when I can simply do:

```
Atari <-SIO-> 1050 <-SIO-> SIO2SD
| |
Floppy SD
```

Or is it _really_ worth doing it this way?

```
Linux <-serial-> SIO2PC <-SIO-> 1050
|
HDD
```

Keeping in mind that I have one of these:
http://www.atarimax.com/sio2pc/documentation/index.html

The docs to the 080714 (0.30-pre3) of your AtariSIO that I have
sitting here says:

atarixfer is used to read/write disk images from/to a Atari drive
connected to your Linux box with an 1050-2-PC cable. An APE
ProSystem cable will also work, but you have to add the
command-line switch "-p".

So I should be good, with the "-p" option? :)
And when's the next release of AtariSIO? The latest version
I see posted (0.30-pre2 from 2004-08-31) is older than the one I have!

This is the right place to find it still, right?
http://www.horus.com/~hias/atari/#atarisio

Thanks! (Still kind of fuzzy on all the possibilities & (in)compatibilities
out here ;))

Try this. I'm not really sure how the XIO command works with MyDOS or
BLOAD in Turbo BASIC for that matter. You may need a PLA or three in
there to clear the stack. The press any key still happens in the call,
You should be able to run it a couple of times to see if it messes up
BASIC or DOS. This one still uses bottom half of page 6 so you
shouldn't be able to use it with MAC/65 or DDT at the same time.

Almost :-)

It's better to go for a card that is specced up to 921kbit (the one
you mentioned only supports 460kbit). Although you don't need the
high bitrate for the Atari, it has the benefit of offering a finer
grained bitrate control. So far I only implemented hand-crafted
bitrate settings (for all Pokey speeds) only for 16C950 cards
running up to 921kbit.

BTW: the terms to look for when searching are 16C950, 16C952 (or just
short 950 / 952), Oxford Semiconductors, and of course 921kbit.

You have to look closely at the specs, some ExpressCards just use
a crappy Prolific 2303 USB chip (which doesn't work at all with
AtariSIO and even with AspeQt it works extremely badly).

> (It's $55 USD at that site, at least)

Ouch, this is quite expensive. I ran across several ExpressCards
for some 15-25 EUR here in Europe, but so far I haven't tried one
myself (I don't have a laptop with an ExpressCard slot).

Only if you really want/have to do a lot of disk imaging. Transferring
floppy disks to the SIO2SD is a PITA because you can't create new
ATR images directly with the SIO2SD. OTOH using atarixfer for that
purpose is a lot more comfortable (you can name the ATR file
when you read the disk, place it in the right directory etc.) and
also faster (the data has to pass the SIO bus only once instead
of two times, when copying with the Atari).

But I also wouldn't spend $55 for the card, this is a little bit too
much (some $30-$40 would be my personal limit).

I'd say yes (if it doesn't work just bug me and I'll have a look at it :-)

> And when's the next release of AtariSIO? The latest version
> I see posted (0.30-pre2 from 2004-08-31) is older than the one I have!

Please use the development snapshots (current version is from 2010-02-28)
from the snapshots directory.

These snapshots are usually very stable (I only upload them when I did some
testing). There's quite some new code in AtariSIO (for example I rewrote
large parts of the kernel driver some time ago) and I was hoping for
a little bit more feedback from people using it. I don't know if anyone
except me tested the 16C950 code, maybe some people did and it's working
fine for them, but I never received any feedback about this :-(

So, for now I won't publish any planned release dates, I just do it
like the MPlayer guys (use the current snapshot) combined with the
Debian philosophy "it's ready when it's ready" :-)

> This is the right place to find it still, right?
> http://www.horus.com/~hias/atari/#atarisio

Yes, the URL is still correct (just go to the snapshot directory).

so long,

Hias

Unless what you intend to copy is stuff you created yourself, you'll probably find that most of the work has already been done for you, and the ATR files are sitting in various online archives waiting for you to use them. :)

Sounds like it was. Someone sent me a graphics & sound demo ARC file
that included it (IC.COM inside GRSN2A.ARC). It must've been the
CompyShop that I saw it in originally.

And it was actually an early APAC style demo (alternating GR9/GR11).
Wish I had it to play at my Atari Party earlier this month. ;)
(Was too focused on new stuff, like "Pure" and "Polymatrix" demos
and "Yoomp!" and "Crownland" games ;))

Thanks!

Can anyone tell me where I can find a rom image of the original
Atariwriter cartridge? Every rom site I've found only has disk images
of Atariwriter Plus, not the original Atariwriter on cartridge.

Thanks.

I had originally downloaded it a while back to make a cartridge
out of it. Went to find it on my hard drive, but, it's such a
mess, so, I decided to relocate it online. I googled 'Atariwriter'
and clicked on the first link, a Wiki page. At the bottom were a
list of links to other sites, one being AtariAge.com so I went
there and it was a page about the Atariwriter cartridge, which
included a download link, and there you have it. 8^)

Try this. I'm not really sure how the XIO command works with MyDOS or
BLOAD in Turbo BASIC for that matter. You may need a PLA or three in
there to clear the stack. The press any key still happens in the call,
You should be able to run it a couple of times to see if it messes up
BASIC or DOS. This one still uses bottom half of page 6 so you
shouldn't be able to use it with MAC/65 or DDT at the same time.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

This should do it, but I didn't test it a bunch. I moved the variables to page zero, $CB-$CE or so which makes it a bit shorter and faster if more colors need to be stuffed. Should work from BASIC or ASM/ED cart now, MAC/65 may work but probably not DDT. It is in the upper half of page 6 so even a BASIC INPUT A$ won't trash it. If you want to slow it down replace that 9 in line 1030 with a higher number like 99. Makes it a little easier to see if your display is glitching.

Just read a article on yahoo entitled "Atari Founder Revisits Roots with
Missile Command."

Below is the link if anyone wants to read it.
I'm not sure which Warner he is referring to, I suppose
it's Warner Brothers.
I still like the look of the XLs to the XEs but that's just one's
own taste to the case. All software is compatible except for
maybe a few programs that are specifically written.

http://videogames.yahoo.com/events/missile-command/atari-founder-revisits-roots-with-missi
le-command/1390303

Can someone enlighten me as to what Warner did wrong on
the Brand?

Warner Bros. put a lot into Atari, but the game computer market
crashed, and Warner was losing a lot of money.
I'm not sure it was Warner's fault. Sega, Nintendo, were just coming
up, but the world sorta lost interest
in video games. There was a split personality of whether Atari
should be a computer or a game consol.
Warner stopped development of a 16 bit computer/game machine, and the
talented engineers left.
The main engineer, Jay Miner, went to Commodore. The mistakes of
Commodore were worse than
Atari, just lots of waste and not much discipline. Then Warner sold
Atari to Commodore's Tramiel family
and Commodore's 16 bit machine went to Atari, and Atari's 16 bit
machine went to Commodore.
(Atari ST and Commodore Amiga). The ST never took off, neither did
the Amiga. I believe Atari
lasted longer than Commodore, but not by much. Today, Atari is
mostly valuable because of the
software that went with it, not the hardware.

3881. VM02 v1.0 Released! April Fools???

Newsgroup: comp.sys.atari.8bit
Date: 2010-03-31 13:11:25 UTC
From: DaveSchmenk <dschmenk@gmail.com>
Message-ID: <3a8063a3-3a64-49a8-91df-28c63c189797@x11g2000prb.googlegroups.com>
Source record: 1470
Cross-posted to: comp.sys.apple2,comp.sys.atari.8bit,comp.sys.cbm

Years ago, you may have seen this announcement about Java running on
an Apple //c:
http://www.desnoix.com/apple2/
Initially looked like they had pulled it off, but after a brief
inspection it was revealed for the April Fools joke it was.

This is no joke.

Announcing version 1.0 of VM02, the Java compatible VM for 6502 based
Apple II computers. Running on the full line of Apple II computers,
from the Rev0 Apple][with Integer Basic, to the last-of-the-line
Apple //c+, and everything in-between. Most basic features of a Java
VM are implemented to allow direct execution of standard Java class
files.

Download here:
http://sourceforge.net/projects/vm02/

Screenshots here:
http://sourceforge.net/project/screenshots.php?group_id=239665

There are a number of packages available to suit different
configurations. There are three ShrinkIt archives: the full version
supporting floating point numbers and demand memory swapping, a
minimal version without floating point or swapping to increase
available RAM for machines without an adequate swap device, and a full
version with debugging enabled for developers. There are also DSK
images available to help with "sneaker-net" installation.
VM02.EXTRAS.DO contains all the samples classes and the Character User
Interface classes. There are then the 64K and the 128K versions.
140K is just too small to have a combined image, so they have been
split apart. The VM02 version is for 64K machines, VM02E is for 128K
IIe and IIc machines. These are meant to install on a larger drive,
as no ProDOS is included on the image. Finally, there are the minimal
versions of VM02 (VM02.MIN.DO) and VM02E (VM02E.MIN.DO) for booting
and running on floppy-only machines (ProDOS included on the image).
The only difference in these images are the actual VM image, the
system classes are identical. To install on a hard drive simply copy
the EXTRAS image and the appropriate VM02 image to the same directory.

In order to fit in the constraints of a 64K, 8 bit, 1 MHz computer,
some aspects of a JVM have been reduced or removed.

What is missing:
- 64 bit data types unimplemented

- Standard class library missing or limited implementation
- Lots of memory

What is implemented:
- Standard Java class file loading and execution.
- Full object inheritence
- Pre-emptive multithreading (4 threads max by default)
- Exception handling
- Arrays up to 15 dimension
- 32 bit integers and single precision floating point
- Garbage collection
- Demand memory swapping to RAM disk or other available volume
- Finalizers
- Software and hardware implemented timing
- Device drivers for common hardware (80 col/mouse/serial/uthernet/
graphics tablet)
- 128K memory support for //e and //c
- Full access to Apple II platform features

VM02 is implemented from scratch in 6502 assembly, optimized for the 6502 and Apple II platform. The entire VM fits in about 20K of RAM after initialization. This leaves about 30K of RAM available for data and code in the 64K version, or about 32K for data and 44K for bytecode in the 128K version. Not a lot, but Java was defined for small platforms so you can get some reasonable programs even in such a small space.

Performance is acceptable for a 1 MHz, 8 bit CPU; on par with the UCSD p-System VM used in Apple Pascal. As with any memory managed environment, garbage collection can really take its toll on the system. CUI (character user interface) programs will attempt to force some startup garbage collection and memory swapping to improve the initial response of these programs. Java can eat through 32K of RAM in no time. If you think the computer has locked up, a little patience will probably pay off with the resumption of execution. Demand memory swapping on an Apple II isn't the most brisk operation it can perform; CF disks and RAM disk greatly aid the speed of swapping. Other garbage collection operations involve defragmenting RAM - an accelerator will improve this.

All features of the Apple II are made available through either specific classes, a low-level class that can access ROM routines and memory, or both. A high-resolution graphics page is available for use with small programs. There is a device driver architecture that currently supports 80 column cards, the Super Serial card, and the Apple Mouse card with preliminary support of the Uthernet card and Apple Graphics Tablet. Probing for the Uthernet card can cause problems in some machines with hardware VM02 doesn't detect. If probing for the Uthernet card causes the machine to hang at VM02 init time, hold down the Open-Apple key (or PushButton 1) during initialization and the Uthernet probe will be skipped.

Swapping from main memory extends the available RAM, dependent on the swap volume. VM02 will automatically take advantage of large hard drives or RAM disks for swap volumes, giving precedence to RAM drives. If you have a RamWorks card, you must load the ProDrive RAM drive software before running VM02 in order to use the extra memory. "Slinky" style memory cards are automatically used. IIgs computers should have a RAM disk of 256K or greater to use for swapping. AUX memory in the IIe and IIc computers is used for storing the Java bytecodes, thus freeing up main memory for data.

Class filenames are missing the ".class" suffix due to filename limitations, however the file type of $ED is used to identify class files and are given the type identifier of JVM. System classes are in the JAVA/* subdirectories. Apple II specific classes are found in the APPLE2/ directory. VM02 specific classes are found in the ORG/VM02/* subdirectories.

Included with VM02 are sample classes that show off the capabilites of the environment. They can be executed from the samples disk or copied to another location.

HELLO - A simple text entry program
HELLOWORLD - sample multi-threaded program
MOIRE - Hires example, requires AppleSoft in ROM
HIRESDEMO - Another hires demo
RODSCOLORS - Lores demo
SIMPLEPONG - Lores demo with paddle input
TERMINAL - Simple terminal program using the SSC
VOLUMES - List online volumes
CATALOG - Catalog a directory
LIST - List a text file to the screen
STRESSMEM - Allocate 64K 2D array. Stresses swapping code
TESTSELECT - select() type call using mouse, keyboard, and timeouts
TESTCHAIN - Chain to another class passing parameters and exit status
TESTARP - Send ARP request from Uthernet card
TESTCUI - Show off the CUI's controls (128K and hard drive install required)

With this release of version 1.0, a file launcher utilizing the character user-interface classes is included to navigate through volumes and directories and execute Java classes. Files of type $ED show up as JVM executable files. Requires 128K IIe or IIc.

Cool! So if the JACE virtual filesystem concept worked for VM02,
then .class files should surface with file type $ED -- any aux type
needed or do I leave that as $0000? Only major kink is that JACE
virtual filesystem doesn't support writes. Is it possible to have
VM02 have a configurable block device (say /RAM on slot 5) for memory
read/write? Would be rather funny to run a java program that emulates
an apple which turns around and runs another java program. Or would
that be sick? Not sure. But it would be fun all the same. :-D

Thanks for all the work you put into this!

-Brendan

I was using the AUX values when writing out the swap files but
Virtual][wasn't always returning the same value I wrote. Since I
was placing the reference count of the memory block in the AUX value
it caused real problems when this would come back as zero. So I don't
use the AUX value any more. In fact, the file type isn't required,
it's just used by the launcher to identify class files. You can try
and run any file type from the command line.

If the memory block comes up as a /RAM disk, then no problem. Also,
if you run the minimal versions, they won't do any writes unless the
class does. You can't run any of the larger classes (like Launcher
and TestCUI) because they require swapping.

I downloaded it and tried it out...

1) disk has no DOS. you must boot prodos from another disk
2) after prodos is booted, you need to change the prefix to /java,
so at the] command prompt, type:
]prefix /java
3) -java.system shows the readme.txt file. a spinning cursor in the
lower right corner indicates the VM is doing something in the
background? then on the bottom of the screen in inverse it says
"press esc to exit, arrows to scroll". the spinning cursor is gone.
escape key does nothing, arrows do nothing.

I am using applewin 1.18, mouse card enabled. Enhanced //e mode.
Prodos 2.0.3 from the prodos system disk 4.0.2

I downloaded the SHK from :

http://downloads.sourceforge.net/project/vm02/vm02/vm02-rel1/vm02.rel1.shk?use_mirror=superb-sea2

and converted to a 5mb .PO hard disk image.

Am I doing something wrong?

Rich

3895. SIOtoPC info...

Newsgroup: comp.sys.atari.8bit
Date: 2010-04-01 17:55:01 UTC
From: phantomm_1 <phantomm@suddenlink.net>
Message-ID: <4bb4de7d$0$12421$bbae4d71@news.suddenlink.net>
Source record: 1484

I've a SIOtoPC that I bought new awhile back.

I would like to use it with an Atari MegaSTe and or an Atari
Falcon using the serial ports.
What I'd like to do is have it connected and
transfer files to the Atari 8-bit from the STe or Falcon and to
the STe or Falcon from the Atari 8-bit.

Has anyone tried to do this?
Or is it even possible with the SIOtoPC hardware as is?

SIOtoPC Software

I'd like to know what software currently works with the SIOtoPC?
Which software to use when connected to a PC with Serial ports.

And if anyone has used any other software such as a telecommunications
program for any computer system, I'd like to know what will work, if
anything else does.

AtariMAX USB cartridge

I also have a USB cartridge for my 8-bit from AtariMax that I bought new.
Has anyone came up with any fun projects for it?

Can any files be sent thru it to a USB port on a PC or
anything else?

If so, what software would I need?

Any info, discussion is welcome...

Barry

Greetings,

I read some postings in here awhile back relating to copyright/patents.

Something about the dmca was mentioned .

I'd like to know if anything related to early computers such as atari, has
been discussed/changed in the world of copyright/patents.
Especially things related to program and file formats, video, audio and etc.

I have some knowledge, but would like to read anything interesting.
Also, any links where past and current info can be found would be useful.

Only thing that counts is the most recent and what applies to digital.
google 'Digital Millennium Copyright Act' for the skinny. Doesn't
matter if Margaret Mitchell's family still has the copyrights to Gone
with the Wind or Disney copyrighted Mickey Mouse, digital is treated
different. People can form their opinions for themselves but IMO [old,
no platform, no support, no market] => no longer under copyright
protection according to the DMCA. It's still a little vague in that
they don't say a date or platform or market size.

Patents run ~19 years, mostly fixed but there are ways around it.
Complain FDA testing delayed market introduction of your medical
device to get an patent extension for instance. Everything Atari is
long off patent.

There are no patent or copyright police. All intellectual laws do is
give you grounds in a civil suit. All you can recover are damages and
shut someone down/prevent them from using or distributing something.
If someone is ordered to stop distributing copyrighted material or
infringing on a patent and don't, contempt of court and time in the
Gray Bar Motel.

There's still ways for companies to evade the intent of the law and
some of them may be legit. For instance you would probably get in
trouble if you used a plumber with a big mustache in a game because
his image is copyrighted. I heard some companies were copyrighting the
images of their ICs. Kind of ironic in that everything digital in a
cart may be fair game now but don't try to make a copy of the orginal
box.

Not entirely true... Customs Enforcement can and will seize items that violate US patent, trademark and/or copyright laws. The FBI and Treasury Dept. routinely roll up folks that illegal duplicate and distribute media.

However, as with most things in this county these services are rendered to those sitting on the largest piles of cash.

Do you happen to know the background process for this? Specifically
how is John Law made aware of things like Rolex or Armani knockoffs?
Donate a million bucks to some /senators reelection campaign or
something?

I'm under the impression that you can't just call up the local sheriff
and tell him your being repressed. Every case I have been involved
with goes through a process of starting with nasty letters drawn up by
lawyers<stop or we'll lawsuit the piss out of ya> followed by
depositions and proceeding through court orderred redress of
grievances. True my experience has only been with patents but I
imagine it works the same way for other intellectual property.

Remember the Windows look and feel vs. Mac stuff? If Apple could of
done it w/o going to court by just having a cop put a padlock on MS
headquarters door I'm sure they would have. You can't just accuse
someone of something and have it stick, writ of habeas corpus type
thing.

Rick, you said Digital is different.
How are they defining digital?

If I photograph something, I can copyright my photo on paper as well as
in a digital format correct?

It applies narrowly to software if I read it correctly. For instance
the Atari OS chips binaries would be fair game but the OS source

listing as published in ~"Atari 800/400 Technical Reference" would still have parts that would fall under the same copyrights as books. Nothing is official until it gets tested in courts and afaik there haven't been any cases yet. Kind of stupid the way the system works in that we have laws but if someone doesn't like the law they can appeal all the way to the supreme court. Even the supreme court makes mistakes that have to be reversed, see Dred Scott decision.

Lower courts apply what is on the books and higher courts decide if that decision and the law itself are good.

I've been there: What first happens is civil court, an appeal, a judgement which can be made public in which case it becomes law/ guidline for lower courts for now or it is sealed/not published which kind of indicates it was a crappy decision by the lower courts but not bad enough to embarass them by publically by reversing it, followed by appeal to the state supreme court followed<?> by supreme court on constitutional grounds. i.e. the copyright holder makes a case they are unlawfully being deprived of their property. At the higher stages of appeals the court can just decide they are too busy to hear the case. They can even kick the case back down to a lower court if they feel like it. If either the plaintiff or defendant blink at the $1/4 million or so it takes to do this, case is over. For the record nothing I have ever been involved with went beyond the state supreme court.

Unless the people involved are spiteful lawyers with a lot of time on their hands it would be too expensive to litigate. Something like WordStar for CP/M or PKARC for DOS probably don't generate a lot of income. If someone wants to run a copy of WordStar under a CP/M it wouldn't make a lot of sense for MicroPro to rise from the dead to sue. If a new iPhone is distributed with WordStar on it maybe it would get some interest but that is at the heart of the problem, nobody at Apple would be that stupid. Big targets aren't that stupid and little targets aren't worth it.

I can't remember which lawyer said this but it came out something like ~"being wrong doesn't stop you from filing a lawsuit, it just stops you from winning."

That action culminated in the beheaded Charles I <Cromwell, great
flick!>. There was a movement to have the same remedy applied to Mr.
Bush until someone pointed out that removing his head, lacking any
vital organs, would not have a significant effect on his health.<grin>

Message-ID: <f4709fa9-6fbe-46da-9769-2b4126b2a73f@g10g2000yqh.googlegroups.com>
Source record: 1493

http://www.youtube.com/watch?v=AknyR-kRvLc
lmao

Ten minutes of your life you will never get back.

Halted Specialties used to have a pile of 5200 motherboards for $7;50 each. I would buy them for parts since they had all the Atari custom chips except the 6520 but that was commonly available anyway. An old girlfriend's sister used to work in Atari customer support. She would laugh and make fun of the people who called up complaining about their 5200 system. I figured nobody would miss a 5200 on a plate vs. using the parts to get something useful like a 800XL running. I still have one 5200 MB left but I saw the Atarimax 5200 flash cart and thought I should double check if the system was suddenly seen as worth preserving. I found that Youtube video and it refreshed my memory! I don't think anyone will miss it.

Anyway, I'll see if I can get the 5200 MB to boot, it is the older 4 controller model. I've been wading through the tech ref and my plan of using a 130XE with an Action! cart as a development system seems to be going well. Soon as I get a "Hello world" demo to run I will pack it in. I be thinking the 5200 would make a better computer then an 800XL. For instance if I just decode the memory map with something like a GAL22V10 I can put chips back in their original 800 location, use an 800 OS, keep the $C000-$CFFF open for banked ramdisk, have 32k available as cart space. I want to lose all the conflicts with video and interrupts glitching while switching banks like we see in a memory expanded system based on banks in the 32k-48k region. I grow tired of the PIA bits being used for bank switching. It could work like any of the existing designs i.e. toggle address bits like the OSS Supercarts or actual memory mapped register like a 74LS374 or even another PIA just for that purpose.

Rick

Posting-Frequency: 10 days
Last-modified: March 31, 2010

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Many suggestions... but one -very good I think- is missing!

Have you heard about the SIO2USB-Interface? It plugs directly into your
ATARI Computer and connects it with an USB-Stick.

So to copy a disc, connect your ATARI to the 1050 and the SIO2USB. Plug
an USB-Stick in the SIO2USB and select it as drive2. Then copy your
discs with any sector-copy program to the USB-Stick. That's it!

Look here for more information about the SIO2USB or conntact me:
http://home.arcor.de/grasel/restarte.htm

Hi Barry,

I also ordered but have received noting nor reply from atari max
(april 2010). For your qeustion: You need the software from atarimax
for extracting files from the atari or reading in .atr files (atari
emu games for instance) from your pc. I gather your pc then behaves
like a atari disk drive.

ps How long before you received your sio to pc interface. I live in europe. Maybe that's why it takes longer...

cheers Henk

It definetly rings a bell with me. Can't say where it is though.
I would have to dig through my 8-bit stuff.

I believe you should get some communication from Atarimax about your
order.
He is well known and trustworthy, but maybe you should go to Atarimax
and
try to send him an e-mail.

order.
He is well known and trustworthy, but maybe you should go to Atarimax
and
try to send him an e-mail.

Yes, thats what I'll do.

I just thought, that maybe someone else had written some different software
for these devices.

thanks,

It was part of AMS song (Advanced Music System). The song was one of
several popular ones that were part of the demo showing it off. Others
included "Thriller" and the "Star Wars Cantina."

Should be easy to locate.

I remember that! It seemed very impressive at the time. I once used it
as a jukebox at a church activity.

3919. ATR8000 to 8" drives wiring

Newsgroup: comp.sys.atari.8bit
Date: 2010-04-17 08:33:04 UTC
From: ricortes <ricortes@earthlink.net>
Message-ID: <e68a4b20-fab2-48eb-8903-4ab250e86d4b@y17g2000yqd.googlegroups.com>
Source record: 1258

I seem to recall there was ~a hand drawn doc that circulated for making your own 34 pin to 50 pin conversion so you could use 8" drives with an ATR8000. I've googled it quite a bit but only ended up wasting a couple of days. I even found some stuff that looked just plain wrong and dangerous. Does someone have the correct doc for this?

I did find SWTP made an adapter board and someone sells a board that's supposed to do it for a small fortune.

I could just wing it but have you seen the prices for some of this junk on eBay? I can't believe any of this is selling but they are asking $300-$600 for 8" drives and you can't touch a used 3.5" 720k for under $100. I think I may gut my 520 STs!

I forgot how feeble the low level IBMs were and how weak a bunch of my junk is. I still have some ~sought after stuff like a Microsolutions CompatiCard I but I had forgotten the only way it could access anything other then a 720k drive was to load a driver. My eprom burnner needs an ISA slot so it has been a comedy of errors. I have several spare system MBs with ISA slots ranging from a 10 mHz 8088 to 500 mHz K6. The new copy of DR DOS I bought to run the burner came on 1.44 meg disks so matching a MB to disk controller to floppy has been an adventure in 8-16 bit vga cards and everything from an genuine IBM 10 meg MFM hard drive to a 6 gig IDE.

SCSI has been a disaster, 3 broken 8 bit controllers and 3 broken drives. Only have 2 PCI controllers and one of those is so old Win XP refused to install it. Error message was something like "Go back to Windows 95 loser!"

I'm kind of leaning towards a 33 mHz 486DX for my development system but the MB doesn't have anything built in. Only working 16 bit hard/floppy controllers I have are MFM. I may have to make a run to Halted Specialties or Weird Stuff Warehouse so I can set it up right. Things are good, kind of nice to remember how good DR SID and editor were. Loaded Viewmax<ST GEM style interface> but it only recognizes serial mice.

Rick

Hey Rick,

Long time since we last chatted.

Though not specifically for ATR8000 these links should help.

http://www.retrotechnology.com/herbs_stuff/34_to_50.txt
http://www.classiccmp.org/dunfield/img20385/cnct.htm

A bit off topic but I'm wondering if this will enable the use of 3.5"
HD drives on our ATR8000s.

http://majzel.blogspot.com/2009/04/converting-from-8-to-35-inch-floppy.html

And completely off topic I finally found a fix that allows me to use
both my SIO2PC interface (MAX233 based) and the ATR8000 at the same
time. I read about it somewhere on usenet a few years ago but can't
seem to find it again. Just add a 2K resistor at SIO-5 (data out) and
SIO-7 (command) on the SIO2PC interface.

I was thinking the same thing and went so far as checking to see if I
had any Mode 3 floppy drives but no love. There are a couple of
sellers on eBay that have that exact drive and there seems to be a few
other models that work Mode 3. I'd guess you just have to treat it
like a DSDD 77 track 8" drive from MyDOS, use 1.44 meg disks, and you
get ~1 meg formatted capacity but you probably have figured that out
or something better.<grin> The old 1.2 meg 5.25" disks are supposed
to work Mode 3 too but good luck finding floppies.

I'm kind of going through an advanced state of confusion vs. bucket
list. I've got to see an 8" drive hooked up to my ATR8000<bucket list>
but the way to go and what I should work on is a direct attached SD
card. Not sure if I should just hang it off a j/s or put it under the
hood. Stuff I've been reading makes it seem like a simple serial type
data stream for the SPI mode will do.

Rick Defelson<?> or something close. The 'Rick' part is right but I'm
not sure how to spell the last name. He's still around and has a web
page. But yeah, both the MAX232 and 1489 have load resistors on the
chip. Sheesh! Just found it while I was looking for the equivalent
circuit for the 1489.
http://www.a8maestro.com/atari/info/virtsio/pic1489.jpg

Anyway, the 1489 <and MAX232> have on chip ~4k of resistance going to
the middle of a resistor divider network to keep from oscillating when

nothing is hooked up. IOW: They are always presenting a load either
pull up or down respective to the SIO data lines. Really it would have
been better to use something like a LM324 op amp but hind sight is
20/20.

The ATR8000 w/ SIO2PC was a thorn in my side for a long time.

I'm not sure I understand your description of loads but the ATR8000 becomes invisible when an unmodified SIO2PC is connected to the chain.

The 2K resistors did the trick for both the MAX233 interfaces and my 14C89 one though the 14C89 one no longer worked at 3X SIO with the long 25 foot cable I have. Shorter cable was working but tempermental. MAX233 is perfect so I dumped my 14C89 interfaces.

Rick Detlefson is a great guy. Sold me a nice SDrive kit (then I made a stripped down one from scratch). He also helped me with another age old wish (not quite a bucket list though). I just couldn't get 1.2MB floppies working on the ATR8000 on my own. Can't remember the tip (maybe change DOS versions) but until whatever the change was it had never worked for me.

I wonder how long it will be until I get a 1.44 up and running.

Take care Rick, and good luck with that 8" monster.

I see some effects of deleting STA $D40A some breaks in the lines.

No big thing, you know how SCSI, MFM hard drives, some floppy drives, needed one set and only one set of terminating resistors? RS232 has a similar type of spec in that the originating device expects a load resistance on the reciever end. The resistors are in the silicon of the MAX and 1489. If you measure the voltage on an IBM style serial port INPUT you will find it actually has a voltage on it instead of floating because of the on chip resistors are wired to V+ and ground pins. They also have series resistors on the outputs and inputs to prevent you from burning them up should you short them to ground or +V.

IOW: It already has pull up resistors on chip, just that they are the WRONG values!<grin>

I seem to recall the 1489 could handle ~dead short to ground on all outputs while they were being driven high w/o burning up. That was really the thing that made it an appropriate for target users on the Atari. Ditto for the MAX232.

I think it was you that sent me schematics, I'll take a look at them and see if I can figure out what goes on with an ATR8000.

Rick

I'm guessing you are using paddle values as they get increased for the
scroll? Do you have a paddle controller you can plug in to see if that
effects the output?

First time in ages I hooked up a real Atari. Yes, paddle 0 effects
the scrolling, just makes
a blinking display instead of the rainbow.
```

APE for DOS won't work with Windows XP, even in SAFE mode, the serial
port won't work.
I had to boot PC DOS from a GHOST disk to get APE 1.18 to work with my
APE/PRO
adapter. I never did use paddles for anything.
I don't know why $D200 is used, actually, $14 is the jiffy clock,
which gives a different
value for the color to change to. I got the program from a Atari Logo
BASIC program,
makes the Atari logo rainbow with a down rainbow outside the drawto
fill box.

In the ones I posted I used VCOUNT which is just the scan line divided
by 2 IIRC. I'm not sure about all the details but I think it takes
262/2 scan lines into account with overscan. I thought the POT
routines were tightly linked to scan lines too but only go to 228?
There's also a fast read POT enable that was used for things like
digitizing speech but I never used it myself.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Hi,

Read on <http://www.edge-online.com/news/bushnell-rejoins-atari>

Bushnell rejoins Atari

Nolan Bushnell, the 1972 co-founder of Atari, has joined the new company’s Board of Directors.

Bushnell has created over 20 companies since the original Atari and has been inducted into the Video Game Hall of Fame and the Consumer Electronics Association Hall of Fame.

Also joining Atari's Board is Tom Virden, a "seasoned executive in the online leisure, technology and travel businesses who will bring Atari his strong knowledge of online business and e-commerce."

Bushnell said: “I am very excited to be reacquainted with Atari at a time when it is poised to make interesting strides in key growth areas of the games industry. The company and its iconic brands have always been important to me, and I look forward to further guiding them at the board level.”

Other notable changes to the Atari Board include the departures of previous CEO David Gardner and Phil Harrison, who have both resigned from their Board roles.

Atari said that the two Board appointments come at a time "when Atari has increased its focus on its iconic brand and world-renowned game franchises while further expanding its business online."

ATARIstically yours =)

Shoulda had a PLA at the beginning, keep the stack right.
Add a 104 at the beginning of line 1000 DATA and make N=1536 TO
1536+34 at line 10.

Hi,

Do you know that France is a beautiful country ?
I'm sure Nolan Bushnell will really enjoy the trip.
I know California myself. It supports the comparison :-)
I watched recently "2012" on the PlayStation 3. The time
is not yet come to think about those big catastrophes.

This is in facts, a real good ATARI News, indeed !

Best regards,

Online Training in SQL DBA

Maripax Offers Online Training in SQL DBA

Experience online training! Experience as you are in home while you learn something important. No need to search for coaching centers. Your trainer is just ready on your computer.

Save time! Because time is precious. Don't worry where you are from? Connect to internet and learn in the best way! We look for the things what you really need! We train you to make you best in industry.

If you are excited about technology, it is enough from your side. We take care of remaining. We train what you exactly need. We train to make you best in industry.

Either you are beginner or professional, our course content is designed rationally after evaluating so many factors in course-framing decision making system. To train you and to make you best in industry is our passion, our socio-economic service, our contribution to the IT industry.

Break the barriers. Build technology around you, for you, from you. We there for every new technology. For every new technology we train IT aspirants. Experience technology-learning by us that makes any thing possible by eradicating the statement, "is it possible?!" Never lack a single step in IT training.

Dedication in quality is primary norm of us. No matter what the subject it is, Quality is what we make it as deep as ocean depths and as high as mountain peaks. Just feel our quality experience from any where! Your investment in time and money is very valuable. We know this point and make you the best in industry.

Once again, Join now and feel what quality is and what harmonious experience it is?
Join with us and start your creative thinking and make things innovative.

Course Content:
SQL Server 2008 Administrator (DBA)

1) Introduction to Microsoft SQL Server

a) Microsoft SQL Server 2008
b) Various Services
c) Editions

2) Installing SQL Server 2008

a) Verify prerequisit es.
b) Create an instance.
c) Configure SQL Server 2008 instances and databases.
d) Configure log files and data files.
e) Configure SQL Server security.
f) Configure server security principals.
g) Configure database securable.
h) Configure encryption.
i) Configure linked servers by using SQL Server Management Studio
(SSMS).

3) Creating and Implementing Database Objects

a) Implement a table.
b) Specify column details.
c) Specify the filegroup.
d) Assign permissions to a role for tables.
e) Specify a partition scheme when creating a table.
f) Specify a transaction.
g) Implement a view.
h) Create an indexed view.
i) Create an updateable view.
j) Assign permissions to a role or schema for a view.
k) Implement triggers.
l) Create a trigger.
m) Create DDL triggers for responding to database structure changes.
n) Implement functions.
o) Create a function.
p) Identify deterministic versus nondeterministic functions.
q) Implement stored procedures.
r) Create a stored procedure.
s) Recompile a stored procedure.
t) Assign permissions to a role for a stored procedure.
u) Implement constraints.
v) Specify the scope of a constraint.
w) Create a new constraint.
x) Implement indexes.
y) Specify the filegroup.
z) Specify the index type.
aa) Specify relational index options.
bb) Specify columns.
cc) Disable an index.
dd) Create an online index by using an ONLINE argument.
ee) Create user-defined types.
ff) Create a Transact-SQL user-defined type.
gg) Specify details of the data type.
hh) Implement a full-text search.
ii) Create a catalog.
jj) Create an index.
kk) Specify a full-text population method.

4) Data Management in SQL Server 2008

a) Import and export data from a file.
b) Set a database to the bulk-logged recovery model to
avoid inflating the transaction log.
c) Run the bcp utility.
d) Perform a Bulk Insert task.
e) Import bulk XML data by using the OPENROWSET function.
f) Copy data from one table to another by using the SQL Server 2005
Integration Services (SSIS) Import and Export Wizard.
g) Manage replication.
h) Distinguish between replication types.
i) Configure a publisher, a distributor, and a subscriber.
j) Configure replication security.
k) Configure conflict resolution settings for merge replication.
l) Monitor replication.
m) Improve replication performance.
n) Plan for, stop, and restart recovery procedures.
o) Implement and maintain SQL Server Agent jobs.
p) Set a job owner.
q) Create a job schedule.
r) Create job steps.
s) Configure job steps.
t) Disable a job.
u) Create a maintenance job.
v) Set up alerts.
w) Configure operators.
x) Modify a job.
y) Manage a job

5) Basic Database Management

a) Manage databases by using Transact-SQL.
b) Manage index fragmentation.
c) Manage statistics.
d) Shrink files.
e) Perform database integrity checks by using DBCC CHECKDB.

6) Disaster Recovery
a) Back up a database.
b) Perform a full backup.
c) Perform a differential backup.
d) Perform a transaction log backup.
e) Initialize a media set by using the FORMAT option.
f) Append or overwrite an existing media set.
g) Create a backup device.
h) Back up filegroups.
i) Back up a database.
j) Perform a full backup.
k) Perform a differential backup.
l) Perform a transaction log backup.
m) Initialize a media set by using the FORMAT option.

n) Append or overwrite an existing media set.
o) Create a backup device.
p) Back up filegroups.
v) Choose an appropriate method for moving a database.

7) Implementing High Availability and Disaster Recovery

a) Implement database mirroring.
b) Prepare databases for database mirroring.
c) Create endpoints.
d) Specify database partners.
e) Specify a witness server.
f) Configure an operating mode.
g) Implement log shipping.
h) Initialize a secondary database.
i) Configure log shipping options.
j) Configure a log shipping mode.
k) Configure monitoring.
l) Manage database snapshots.
m) Create a snapshot.
n) Revert a database from a snapshot.

8) Monitoring and Troubleshooting SQL Server Performance

a) Gather performance and optimization data by
using the SQL Server Profiler.
b) Start a new trace.
c) Save the trace logs.
d) Configure SQL Server Profiler trace properties.
e) Configure a System Monitor counter log.
f) Correlate a SQL Server Profiler trace with System Monitor log data.
g) Gather performance and optimization data by using the Database
Engine Tuning Advisor.
h) Build a workload file by using the SQL Server Profiler.
i) Tune a workload file by using the Database Engine Tuning Advisor

Oracle Apps DBA training (11i & R12/12i) is now available from 03 Jan 2008. This course in available via web conference (weekends or late evening) with hands on exercise on installation/patching/cloning.

Key topics in training for Oracle Apps DBA’s
- Architecture, File System and important files
- Installation of 11i/R12
- Patching
- Cloning
- Upgrade
- AD utility

Course Content

Architecture and Overview of Oracle Apps 11i/R12
- Architecture of Apps
- Components in 11i & R12
- 11i & R12 File System including important files

Installation of Oracle Apps
- Single/Multi Node Installation
- Single/Multi User Installation
- Hands on Installation of 11i / R12

Patching
- Database Patch
- Apps Patch using adpatch
- adpatch options
- Hands on practice for patching
- Frequently asked interview Questions in patching
- Startup/Shutdown Apps & DB

Cloning
- Overview of cloning
- Hands on rapid clone
- Advanced cloning options

AD Utility, Autoconfig and other
- adadmin
- Auconfig
- License Manager
- adident
- OAM

Upgrade
- Upgrade scenarios

Key benefits of Online training from us
– Hands on practice/exercise including installation, patching, cloning
– Technical support for next 2-3 months
– Learn at your pace with flexible hours
– Learn from leaders in Apps DBA domain

Thanks & Regards

Nice thing about Blip.tv (at least the way Robert uses it), is
that you can download the source file. I grabbed the WMV and
skimmed through it just now.

Feedback to Robert: it's quite a bit of the raffles. I'd have liked
to see more focus on the games and the people playing them, than me
hollaring numbers out at the crowd. ;)

Mind if I remix it to make a little mini-video based on this?
In any case, thanks! :)

-bill!

to my knowledge, I have never said anything about anyone's wife or mate
in this group or any other. and i have only used the atari groups to post
in
except for a few posting in a stamp discussion group.

someone went way to far, and they don't know what they did.

Hmm, I think, in the bottom right hand corner of the viewer you can pick
".WMV"...

HTHs.

I was able to play it under Linux.

Me too - always, always wanted to attend one of Toads "Fests" and actually
planned on going, and the year I was planning to go, they stopped.

What I got for waiting. :(

If I win the Lottery, I WILL go to one of Bills! :)

>
>Dunno about 68000 code, but 6502 code here:
> http://mdfs.net/Info/Comp/6502/ProgTips/DayOfWeek

That code is slow & dirty. On the one hand it assumes: that
all dates are stored in non-standard fashion in 3 bytes, rather
than 4 as CYMD (but if there's an over-riding constraint to store
dates in 3 bytes, one may store the 1st digit of the century in
the upper 3 bits of D, and the 2nd in the upper 4 bits of M); and in
the alternative, that CY is to be pre-processed by subtracting 1900
before passing the result to register Y. The latter is cheating--
if that's acceptable, then one ought to cheat properly by looking up
the Century offset in the offset-table, summing it with D, and then
passing the sum to the subroutine when called. As 'month'<13, and
'century'>14 for Gregorian dates, both tables may be combined into
one. Century offsets may be found at:

http://de.wikipedia.org/wiki/Wochentagsberechnung#Jahrhundertziffer

This has the added benefit of the year register always being less
than 100, so that there's no need to test for Century 21. Further
improvements could be realised by rewriting the code to eliminate
the need to invert register A, due to A's total sum always being
less than 100. This will yield another benefit: to have the code
also work for dates in BCD. The code can thus be streamlined to
have a wider range of applicability, yet use fewer clock cycles.

>> additions it could return the julian day number instead; Then MOD7+1

>
>You didn't ask for Julian number, you asked for day of week.

I didn't ask for the day of week either. I'm telling how to find
the weekday number in a different, if not better, way.

Here is the original which still works with the PC for free, they all
use the same SIO2PC cable.
http://pages.suddenlink.net/wa5bdu/sio2pc.htm

ACVT image converter that runs on the PC, converts between
800xldj's .di files and more common .ATR files for example.

Posting-Frequency: 10 days
Last-modified: April 26, 2010

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

I never attended a Toad Fest either, but always wanted to go. I did
attend fests in Chicago, Indianpolis and Vegas. They were great fun
and it was always nice to meet fellow Atarians.

I have also transfered files from the 8-bit to the ST and
vice vera. I used a program on the ST the emulates an 8-bit
drive.

When we got our first PC, I actually used our phone line to move files
from our Atari 8-bit to the PC. You could change a digit in your phone #
which would allow you to call yourself, and I was actually able to get
the two modems to talk to each other, even though there was a loud buzz
in the background (probably to discourage people from using it as an
in-house intercom system). I guess a null modem might have been easier,
but the PC and the Atari were on different floors. :)

Speaking of having to RESET to get out, anyone remember a program called
Paperweight? It would simulate a self-destruct sequence that was pretty
realistic looking. The first time I ran it, it scared me so much I put
the computer into self-test mode just to make sure it hadn't really done
anything!

Do you mean this program?
http://ftp.pigwa.net/stuff/collections/holmes%20cd/Holmes%201/ATR%20Programs/Applications%20A-Z/Paperweight%203.1.atr

BTW: This time you should use the following special selftest to check
if your Atari is still ok :-)

http://www.mathyvannisselroy.nl/selfdemo.com

so long,

Hias

:D Yeah. By the time I ran it, I was using a C= monitor,
so the snowy static effect didnt trick me, but I did
find it hilarious.

Need to go dig that one up. :)

Not to be taken seriously this was a Error.
I just noticed that this some how got posted.
I believe it came from a text adventure game.
Not to be taken seriously.

I get errors on that url. Firefox thinks it is a busted Quicktime
and
IE 7 just gives a WMP error. Is that all there is?

Here's a different source for Self Demo, might be easier to download:

Thanks Michael, I did finally download it, by clicking the URL,
but then erasing the selfdemo.com from the end and going to
Mathy's site and figuring how to save target as, which Firefox
wouldn't
do, needed IE7.

Last-modified: April 26, 2010

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

OK, corrected a few typos like -1 in the data statement and what
damage auto format did to EOLs a couple of days ago but it took me
forever to find time to work on my el33te skills.<sic>

I didn't do the data statement thing, just read the file in from the
emulator H: device and 'pokered' it into page 6, Expands it to 33
bytes. Once again TASM because I keep forgetting what PD assembler I
was planning on switching to. Maybe had oughtta switch it to $680 but
I just wanted to see it run right. BTW: I do have my original Atari
ASM/ED cart as a binary file and my MAC/65 cart.

*=$600
pla

```

I'm not sure why all the monkeying around with RTCLOK was done. Maybe to kill attract mode. I left the first 21 exactly as in the original with the RTCLOK and POT0 thing the original author did and just changed it to hit any key to exit at the end.

Rick

It shows up as audio/mpeg. You need to edit your .htaccess file.

>>
>> >> Hias
>>

Why are you trying to play it in a web browser. Just download it.

>> Here's a different source for Self Demo, might be easier to
download:http://atari.fandal.cz/detail.php?files_id=883

That breaks three rules; it's in a ZIP file instead of a ARC file, the
filename is too long for both the archive and program, and there's
a embedded space in the filename.
And what's a XEX file?
(besides the executable type used by Final Fantasy XI on the 360 game
system)

> wouldn't
> do, needed IE7.

So FireFox doesn't have a "Save as" option under the file menu? That's
what I used in Opera.
(which simply showed me a blank web page instead of trying to play it)
Or you can just type

"wget http://www.mathyvannisselroy.nl/selfdemo.com".
(which reveals the wrong content-type of "audio/mpeg")
Or else try
"lynx -dump http://www.mathyvannisselroy.nl/selfdemo.com > selfdemo.com".
Unlike FTP, there's no ASCII/text transfer mode in HTTP so there's no
chance of corrupting the file no matter how you download it.

Personally I think it's nuts to use a browser (FF or IE) that downloads
and runs machine code from WWW sites.

> 0630 BEQ $600
> 0640 LDA #$FF
> 0650 STA $2FC
> 0660 RTS

This won't do anything unless the user manually runs it via the DOS
"RUN AT ADDRESS" command. You need to add a run address and I forget how to
do that in ASM/ED.
(by the way, anyone know where to download the cartridge image?)
And won't the extra spaces in lines 600,604,609-611 screw up Atari
Assembler/Editor?

Here's your prog converted to assemble under A65:

ORG $600
LDA $D200
ADC $14
STA $D018
LDA $D40B
SBC $14
STA $D01A
LDA $2FC
CMP #$FF
BEQ $600
LDA #$FF
STA $2FC
RTS
END $600
```

Note that ORG is used instead of "*=" to specify the address to store
the programme at and END is used to specify the run address. And the
indentation is needed so that A65 can tell they're not labels.
(I used the TAB key at the beginning of each line but for some reason
there're only 5 spaces now)

Here's the finished product:

[Inline uuencoded payload not displayed: NOWSYNC.OBJ]

Byte count = 147
Checksum = #x21BA
(using YAUE)

I don't know how it works. The POT0 and the RTCLOK are loading to poke into COLPF1 and
COLBK, subracting for one, adding for the other, which makes one go up and the other down and
the clock gives an increasing number for each color to change on a scan line...?

I see a URL, I just click on it and expect to be able to download.
I realize it was an executable URL and not a URL for downloading from.
I don't know how to just download from that URL. I figured that out,
sorta, then clicked on it,
went to the site, then changed the address to just Mathy's site, then
I could navigate to where I could download it.
Hmmmm.... I'm not making much sense, I really don't remember what I
did, but the end is I was able
to go to Mathy's site, download the selftest.com file, use imageman to
put the .com in a SMARTDOS.ATR
and run it from Atari 800 winplus 4 emulator. I realize I don't have
to put it in an ATR, could just run it
in the emulator.

Spaces are not critical in AsmEd except at the start of the line, and then
subsequent fields must be separated by at least one space.

Simplest is:
0670 *=$2E0
0680 .BYTE 0,6

Elegant is:
0580 RUNAD =$2E0
...
0600 START LDA $D200
...
0670 *=RUNAD
0680 .WORD START

Lots of possible combinations with .BYTE, .WORD and labels.

I wasn't AMS. It was in a compy shop demo disk, and I dug it out and
made an .exe/com out of that
particular 'house of rising sun' eight sided graphics demo.
There were about five demos on the disk, another one was a six sided
fast moving dots with music.
Another had a band playing and figures playing music.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

3999. Kjmanns Atari Sales. New Website with better prices.

Newsgroup: comp.sys.atari.8bit
Date: 2010-05-21 11:18:27 UTC
From: kjmann <kjmann12@yahoo.com>
Message-ID: <43af5cd7-c42a-4a0b-9af1-cea5b8f2fc78@n37g2000prc.googlegroups.com>
Source record: 1388

I was So tired of ebay taking so much money out of the sales of the games in my store. I finally decided, enough was enough.

The 15% that ebay charges not to mention the monthly fee for having a store, was getting ridiculous.

In order to break even, I had to charge, $39.95 per game cart, plus a $5.00 handling fee and not to mention the shipping charges.

By the time someone bought a single game, they were in to it for roughly $50.00 or more. that's just too much!

I opened this store to offer these games at reasonable prices, not obscene prices.

So after several days worth of HTML nightmares, Our website is up with Google Checkout! We Ship to all countries.

The prices went down to $34.95 and No Handling Charges! Just Plain old shipping. Priority or Parcel Post. =)

This means a person could buy a game and be in to it for just under $40.00

Check it Out. =)

atari-sales (DOT) com

A Store for Atarians, Run by an Atarian.

=)

Good move. I was holding off on purchase of Action! from eBay for exactly the reasons you cite. Just ordered from your new store :-).

So, uh, stupid question... where's the site, exactly?

You didn't post an URL, and Googling for "kjmann atari sales" comes up
with a lot of links to your Ebay store.

Thanks!

4007. int arrays in Action!

Newsgroup: comp.sys.atari.8bit
Date: 2010-05-23 01:00:33 UTC
From: ricortes <ricortes@earthlink.net>
Message-ID: <39a6aabc-6ec8-4b28-bdd4-a5b12ba4a595@j36g2000prj.googlegroups.com>
Source record: 1396

Ran into a bit of a problem, work around seems a little to
complicated.

Wanted to do

int array foo=[2 1 0 -1 -2]

but compiler balks at the negative values.

I can get it done with

card array foo=[2 1 0 65535 65534]

and then just treat it like an int array i.e.

Printie(foo(3))

gives -2

Is there a shorter/more direct method of doing this? It's not the kind
of thing I do often but I am having to do assignments, print to disk,
inport and format.

Rick

I don't know about a better way, but I'm sure that if ACTION! is a floating point language, then INT will be looking for 0 to 65535, not -32768 to 32767, or it will be -32767 to 32768. I can never remember that. 8^)

Welp, played with it a couple of hours and I think I know what is
going on. Action! does handle ints as 2 byte signed values -32,768
to +32,767 but the way the compiler handles code blocks [data between
brackets] is intentionally left weak for flexibility so it only
handles bytes and cards: It just doesn't know what to do with the
minus sign.

Sucks on one level in that the only way you can declare a variable and
assign it a value is with the brackets i.e.
BYTE foo=[0], bar=[123]
CARD bfoo=[65000]
but AFAIK nothing you can do other then the jerking around with CARD
arrays and maybe a programmer's calculator will let you initialize an
INT to a negative value.
INT num=[-1] ; doesn't work

INT num
num=-1 ;works

I don't use negative numbers or floating point that much. I think I bought my Action! cart back around 1984 and this is the first time I've tried to do the int array thing with it.

I never had an Action! cart. I was thinking of getting one
this past year, but at the time I couldn't find it priced
reasonably. This new store seems to have it at a good price,
but I've bought so many things in such a relatively short
period of time and really don't have that much time to play
with it all, I have to think, 'is it really worth it to me?'.

Honestly at this stage it seems less important. At the time I had a
lot of one off kind applications I had to do like an 80 column
terminal so I could connect to our work computer. It takes me a long
time to write anything in assembly and BASIC is just too slow. Action!
was a good fit for me but it was a long learning curve. Floating point
access is about as hard as doing it from assembly so it's a pretty
narrow range that Action! is best for.

Well Some....Well I can't Say Bad News, But it's just....News. =)
I had to switch to paypal's Shopping cart system because google has problems with overseas shipping. (THIS DID NOT AFFECT PRICING ON MY SITE).

Even though google says it will ship to Places like germany, I had to send two customers from Europe a paypal invoice because google check out said they didn't support shipping to their country.
Google checkout also has NO CUSTOMER SERVICE AT ALL.
OMG, it was the worst experience I've ever had with a company. no phone number to call or Email address to send to. not even a feedback form. just a "choose your problem and click on it" page with cookie cutter automated answers.
No help at all.

So I Spent 4 hours last night typing in all the proper shipping figures into paypal and set up the buttons on my page.

Hope this doesn't inconvenience anyone. =)

The good news is... Still no more Ebay!!!! Hurray!!! LOL

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

http://www.makershed.com/ProductDetails.asp?ProductCode=MKPP1

Down to $30 now huh. Thing seems to be crap on a cracker but I wish I had more spare time. I assume everyone is in the same boat as me, matter of fact I actually have a beater sailboat that takes up most of my free time.

If I have it correctly it is a Nintendo on a chip for the electronics. I'm interested in just exactly how things like the mouse are interfaced. I assume the mouse and keypads are all serial which was no doubt to avoid the Atari J/S patents.

I'm pretty sure the NOAC, not sure how they brought out the cartridge port or anything else for that matter. I think the NOAC has specs pretty close to the original Nintendo so that would mean something like 2k RAM and 2k video RAM, maybe they stuck some in the cart.

Pretty crappy reviews, yes. :)

Here's what I want -- not particularly Atari 8-bit-related, but perhaps someone out here has some ideas. I want to create a remote control (as in, like you'd use for a TV or VCR) that controls my Atari Jaguar. (Seems to be just the standard old Atari 2600 controller port with additional buttons -- at least one widget exists to let one use a Jag controller with platforms with the 2600-style input.)

I'd use it for controlling music in my Jag's CD / VLM toilet seat, without having to dig out a real Jag pad. I'd only need the basic buttons: D-pad, A, B, C, Option, Pause -- that is, no numeric keypad.

sigh

-bill!

4023. New Game Releases at Kjmann's Atari Sales and Service

Newsgroup: comp.sys.atari.8bit
Date: 2010-06-06 11:30:44 UTC
From: Kjmann's Atari Sales <kjmann12@yahoo.com>
Message-ID: <AGLOn.21827$7d5.4742@newsfe17.iad>
Source record: 1412

Check out all the new Game cart releases at Kjmann's Atari Sales and Service!!!

Including a new version of "Donkey Kong" With more authentic sound effects and music. We also added the Intro Animation with kong bending the girders.

Also a long awaited Release of one of the greatest arcade games ever! we found this on a prototype disk, in a file cabinet that was purchased directly from atari when they were selling everything off in 1996. The disk was slightly damaged, but we managed to repair the code and get the game ready for release.

When you look at our new releases page, Remember this Saying.....

"BEWARE! I LIVE!"

=)

Did you get the idea from Xbox?
http://www.amazon.com/DVD-Remote-Control-Xbox-Buttons-Sensor/dp/B000YQSKZC

That thing seems to come with a detector to plug into an Xbox joystick
port. Unfortunately if I have it right Xbox is usb so you would have
to use a linux box with USB to read the signals then send them out the
printer port to the Jag.<grin>

I think Radio Shack used to sell an IR detector/decoder but I don't
see it in their catalog anymore. It was kind of pricey anyway IIRC.

Short story, a friend and her eBay partner bought a pallet of busted up laptops. Lots of weak ~75mHz pentium W/95 with bad battery packs and screens that don't light up. They are<her and her former partner> 99% through sorting out and picking off stuff that sort'a works. Punch line is you can get a working computer in that class for $31 shipped so it is pointless to buy a $60 battery pack or new voltage converter to get the screens operable again. Her educated opinion is she can just E-waste recycle what's left for more then she could sell them on eBay.

That being said, if anyone needs a [2.5", 5V only, .5-1.2g IDE] hard drive let me know and I will pass it on. I think ~$10 would be fair. If you want put it in anything other then a notebook you will need one of those 40 pin to 44 pin IDE convertors.

Archive-name: atari-8-bit/welcome
Posting-Frequency: 10 days
Last-modified: April 26, 2010

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

That's right, geeks... everyone's favourite open-ended, semi-competitive retrocomputing free-for-all is just around the corner. Do you have what it takes to go head-to-head with the hardest-core RetroGeeks in the whole wide world? Me neither, but I do have a bit of time to kill in July...

Those with internet access can learn more about RetroChallenge 2010 at http://www.retrochallenge.org

Hi Everyone,

After getting tired of all the bad attitudes on AtariAge recently, I started working on putting up a new atari discussion board.

I just finished it today.

http://www.atarian.info

hopefully This one will not attract the freaks. LOL

Check it out!

=)

I'm a little confused at your response. =)

I started a forem so I could make some posts and get everything backed
up to The Wayback archive automatically. In about 2 months I have
banned ~1,200 accounts. The nut jobs are the first to show and in the
greatest numbers. I've spent more time banning people then anything
else. Blanket ban of anyone with a gmail account helped cut down on
time spent banning people but the irony is I have to give it an email
address other then my gmail account or I would be banned too.

Rick

So basically what you are saying is, you didn't like the reaction to
your Atari products and decided to start your own forum? Interesting!

Going from an established, well used, well liked forum and starting
your own just because of a few negative comments (whether true or not)
seems a bit of a knee jerk reaction. Now you have to grow your own
site to sell your products, reducing your market by a significant
margin. More forums just dilutes the knowledge and spreads it further
around, a BIG negative for the Atari community.

Maybe just grow a thicker skin?

Comments on any of the products I sell are a VERY small percentage of
the poor behavior on AtariAge.

There is a lot of negativity on AA. What is Sad is that AA was
originally started by some people who wanted to get away from the
nasty people on some of the discussion forums of the time. But now it
seems that AA is turning into what it was originally created to get
away from.

I'm not the only one who feels this way and I didn't start this new
forum to sell the products in my store. I didn't need a forum for
that. less than 10% of my sales are from AtariAge People. Not that I
don't welcome the Patronage from those that come from there, but it
does remain a fact most of my sales are from people who don't even
frequent the forums.

Besides, I don't think its unreasonable to want to chat about these things in a Civil environment, free of insults and rantings by people who have opinions that are not shared by others. a lot of those type of people tend to hammer on others when they don't agree with them.

FWIW: Occasionally I look at other forums including Atari Age. No
great loss but life has me relatively too busy to take part in more
then my occasional post here. AA seems like a good and well run forem
but sheesh the hankie fights get out of control! I thought the Nolan
Bushnell thread was filled with particularily vicious and uncalled for
comments.

BUT the same kind of stuff sometimes happens here and just about any
other forum. I think you could just about have questions on a user
profile that would sort them out. Seems to identify:

Mostly unmarried/unloved.
Dropped out of school after a couple of years of college.<Their
teachers had it in for them!>
Thinks they are smarter then everyone but 2-3 Watson and Crick types.
Believes they have perfect recall on all topics.
When facts and their personal beliefs don't jive, they stick with
personal beliefs.
Strange connection to CB or Shortwave radio. Not that there aren't
great people involved in those hobbies, just that they attract some
real wierdos.
Their opinions are not just opinion but what should be a shared
reality.
They aren't bound by the rules of society like polite conversation or
meaningful contribution to discussions.

Rick

4041. Welcome to comp.sys.atari.8bit!

Posting-Frequency: 10 days
Last-modified: April 26, 2010

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

I haven't seen things like that in users profiles before but I haven't
considered looking at some of the profiles on AA before. Perhaps I
should. LOL
Sounds like there are some people that are in severe need of
counciling hopping around the net these days. =)

As for the Nolan Bushnell Thread, Your Right. It got ridiculous after
a while, as have some other in the past. =)

4044. ANALOG now available online

Newsgroup: comp.sys.atari.8bit
Date: 2010-06-24 01:21:25 UTC
From: russg <russgilb@sbcglobal.net>
Message-ID: <b189e835-fbcb-417a-8747-475389824a84@y4g2000yqy.googlegroups.com>
Source record: 1433

I'm please to learn about the ANALOG magazine archives now available.
There is a torrent of all 79 issues, 7.79 gigs of PDF files, plus
the .atrs of disk from
about issue 9 on.
The PDF torrent is probably more convenient to read than simple .jpg
300 dpi scans
found here:
http://www.pontarohbay.mydns.jp/~frank/analog_computing/index.html

Above effort by a japanese fellow named kowatari.

Both the torrent and part of the .jpg .zips of issues site are largely
by kowatari and
a Atariage user by name of thumpnugget.

I have been interested in years of how to make ANALOG available,
hoping they wouldn't
get lost, and here is the answer. My own efforts to get the last
couple of issues
in my collection, I had a fuzzy notion of how could ANALOG be
archived, but now
I see these solutions.
There are a few holes in the record. One is I don't think there
are .atrs of disks
containing the magazine programs for issues 1 to 8. A second thing
needed
is a good index of articles. Early years of ANALOG published an Index
yearly,
and they were very good. I think the later years, particulary the
Larry Flint years,
I don't think indeces were published.
Ahhh... I have something here, maybe someone knows of a better, but
here is
my index, not mine, it was made by Tom Hunt, I started one, but Tom's
is much
better, issues 1 to 66 tho......Uhm. formatting doesn't come out so
good with
the cut and paste. If anyone wants the ASCII file that has good
formating
my e-mail isn't obfuscated.

So this lead me to the "ok to do this" email sent to kowatari
by Lee Pappas. I wondered who that was and what he's up to.

Well, apparently this!?

http://www.analogretro.com/StarRangers/

-bill!

Pappas OKed the Kowatari archives. I think Thumpnugget's
contributions also derive from the Pappas 'OK'.
Cyberroach got Michael Descenes' (sp?) permision for his archive,
which just isn't going very fast,
and requires OCRing the mags, which puts the mags back in the word
processing scheme. I don't
think ASCII files are necessary, the PDF and JPEGs are easier to read
and more faithful to the original.

I've been trying for years to complete my ANALOG collection, I'm down
to just one issue that I only
have a Zerox of.

Actually, not to start trouble, but I'm pretty sure neither Deschenes
nor Pappas own the rights to
ANALOG, that would be LFP.

4047. ATARI SUMMER STAYCATION!

I take that back (LFP owns rights to ANALOG). I don't know, actually,
but guess that maybe Antic
got the rights to ANALOG when they agreed to take over ANALOG
subscriptions at the end of ANALOG.
Then Antic didn't last much longer than ANALOG. Antic was put in STart
for several months. STart and
Antic went out, last issue 5/91. So ANALOG ended 12/89, issue 79,
then Antic lasted for ...
Here's my record on Antic.

********** Start a cut and paste

Complete list of Antic Magazines

Antic began publication 4/82, Volume 1, Issue 1.
They were bi-monthly for the first Volume, six issues.
Starting 4/83 (Vol. 2:1), Antic became monthly.
They published monthly until 9/89, missing only one month
(5/84), making the volume year end with April issue instead
of March issue. That's 65 consecutive monthly issues from
2:1 to 8:5.

Starting 10-11/89, Antic became bi-monthly again (issue
8:6), and were bi-monthly for only 5 issues. Volume 8 only
had 8 issues. 10-11/89 (8:6), 12-1/89-90 (8:7), 2-3/90
(8:8), 4-5/90 (9:1) and 6-7/90 (9:2), <-- the last issue of
a separate Antic. There was no 8-9/90 Antic. Then Antic was
put as a section of STart magazine for 4 issues (10, 11, 12,
1/90-91). Then STart, still with an Antic 8-bit section,
went bi-monthly for the last 2 issues (2-3/91 and 4-5/91)
then STart folded and that was the end of Antic and STart.

List of Issues/Volumes:
Vol. 1 - Six issues (4-5/82, 1:1) to 2-3/83, 1:6)
Vol. 2 - 12 issues, all monthly
4/83, 2:1 to 3/84, 2:12
Vol. 3 - 12 issues, but no 5/84, so Volume year now ends
April instead of March.
4/84, 3:1, (no 5/84), 6/84, 3:2 to 4/85, 3:12.
Vol. 4 - 12 issues, 5/85, 4:1 to 4/86, 4:12.
Vol. 5 - 12 issues, 5/86, 5:1 to 4/87, 5:12.
Vol. 6 - 12 issues, 5/87, 6:1 to 4/88, 6:12.
Vol. 7 - 12 issues, 5/88, 7:1 to 4/89, 7:12.
Vol. 8 - 8 issues.

5/89 (8:1), 6/89 (8:2), 7/89 (8:3), 8/89 (8:4),
9/89 (8:5), then bi-monthly 10-11/89 (8:6),
12-1/89-90 (8:7), 2-3/90 (8:8).
Vol. 9 - 2 issues.
4-5/90 (9:1), 6-7/90 (9:2) <-- Last issue of
separate Antic. No 8-9/90 Antic.
Then Antic was put as section of STart magazine for 4
monthly issues (10, 11, 12, 1/90-91). Then STart went
bi-monthly (2-3/91 and 4-5/91) <-- Last issue of STart with
Antic section.
That's 94 issues total, including issues in STart, 88
separate issues of Antic.

Hi, Everybody -

My love affair with the Atari 8-bit computer began in 1982. It was my introduction to home computers and programming, and I have loved every minute of it. Now the time has come for me to part with my 8-bit gear. :`(I have a small collection of equipment and software I'm looking to pass on to a good home. [b]One caveat[/b] -- Before packing it up, I successfully booted and have run the self-test routine on one 130XE machine; but since the disk drive is not operating, [u]I have not operated the system otherwise in the past few years[/u]. That said, listed below are the items I am inviting offers for.

Long live Atari!

- AlanK

[u]HARDWARE - Presumably good operating condition[/u]
[list]

[*]Atari 130XE computer, complete w/power supply (C061982), TV adapter, manual (in orig. box)
[*]Atari 850 Interface, w/ power supply (CA014748), manual, serial cable
[*]Atari 410 Program Recorder w/ manual (in orig. box)
[*]Supra Modem 2400 w/ power supply and manual
[*]Microbits Peripheral Products MPP-1000C 300 baud modem, w/ power supply, manual, software (ROM cart.) (in orig. box)
[*]KoalaPad Touch Tablet, w/ KoalaPainter software (ROM cart.) and manuals (in orig. box)
[*]Mannesmann Tally Spirit MT-80 dot matrix printer, w/ manual, extra ribbons (in orig. box)
[*]Alps Allegro 24 dot matrix printer, w/ manual, extra ribbons.
[*]Pengo 25 ft. parallel printer cable
[*]Okimate 10 color printer w/ set-up guide, Atari Plug‘nPrint module installed, and extra ribbons (in orig. box)
[*]Okimate 10 Plug‘nPrint complete module kit for Atari – module, black ribbon, color ribbon, cable, software, printer manual (in orig. box)
[*]Microbits Peripheral Products MPP-1150 Parallel Printer interface with manual
[*]BLE Disk Emulator Routine (allows a spare 8-bit Atari computer to serve as a RAMdisk), complete with ROM cartridge, interface cable, software
[*]SIO-2-PC (allows 8-bit Atari to connect to a PC serial port and use hard drive storage) – includes interface cable, software, and

documentation on disk.
[*]Kraft 8-way joystick

[/list]

[u]HARDWARE - Unknown condition
[/u]
[list]

[*]Atari 130XE computer, w/power supply (C061982) only
[*]Atari 1050 disk drive, no power supply
[*]Atari CX77 Touch Tablet, with AtariArtist ROM cartridge software
[*]Microbits Peripheral Products MPP-1000E 300 baud modem

[/list]

[u]HARDWARE - Not operating[/u]
[list]

[*]Indus GT double density disk drive with power supply, manual,
disks, carrying case
[*]Atari 65XE computer (no power supply)
[*]Miscellaneous joystick parts
[/list]

[u]SOFTWARE – Diskette (5 ¼ inch) or ROM Cartridge (where noted)[/u]

[u]Games, Creativity, Educational[/u]
[list]

[*]A+ Spanish (American Educational Computer) – new, unopened
[*]MasterType (Scarborough Systems) – ROM cartridge w/ manual (in
orig. pkg.)
[*]Linkword Spanish (Artworx) – w/ cassette, manual (in orig. pkg.)
[*]Preschool IQ Builder #2 (Program Design Inc.) – w/ cassette version
as well, manual (in orig. pkg.)
[*]M.U.L.E. (Electronic Arts) – w/ manual (in orig. pkg.)
[*]The Seven Cities of Gold (Electronic Arts) – w/ manual (in orig.
pkg.)
[*]In Search of the Most Amazing Thing (Spinnaker) – w/ manual,
storybook, quick reference card (in orig. pkg.)
[*]Scott Adams Graphic Adventures 1-6 (Starsoft) – w/ hint book (in
orig. pkg.)
[*]Dragonriders of Pern (Epyx) – w/ manual (in orig. pkg.)
[*]Dragon Quest (Antic Publishing) – w/ printed docs (in orig. pkg.)
[*]Orbit - A Trip to the Moon (Antic Publishing) – w/ printed docs (in
orig. pkg.)
[*]Colourspace (Antic Publishing) – w/ printed docs (in orig. pkg.)
[*]Star Raiders (Atari) – ROM cartridge w/ manual
[*]Pole Position (Atari) – ROM cartridge only
[*]The Hitchhiker’s Guide to the Galaxy (Infocom) – diskette only
[/list]
[u]Applications[/u]

[list]

[*]Print Power (Hitech Expressions) – make greeting cards, etc. w/ manual (in orig. pkg.)
[*]RAMbrandt (Antic Publishing) – graphics application, also includes Solid Object Module, w/ printed docs (in orig. pkg.)
[*]Atariwriter (Atari) – ROM cartridge word processor w/ manual, reference card, printer driver diskette
[*]Super 3D Plotter II (Elfin Magic) – graphics application w/ manual, reference card
[*]Page Editor (Alan Kirk) – desktop publishing w/ documentation on diskette
[*]Print Lab (M.D. Software, UK – desktop publishing w/ manual)
[*]TextPro 2.5r (Portland Atari Club) word processor w/ docs on disk
[/list]

[u]Utilities, Programming, Miscellaneous[/u]
[list]

[*]GTIA Graphics, Tricky Tutorial #9 (Educational Software Inc.) – w/ manual (in orig. pkg.)
[*]S.A.M. Tutorial, Tricky Tutorial #12 (Educational Software Inc.) – w/ manual
[*]Advanced Programming Tools, Tricky Tutorial #14 (Educational Software Inc.) – w/ manual
[*]A New Disk Management System (Old Hackers Atari User Group) – w/ documentation
[*]Pirates Treasure Chest (Duplicating Technologies Inc.) – w/ documentation
[*]MPP Express/Mscope (Antic Magazine) PD0087
[*]Going Online (Antic Magazine) ADS0886
[*]The Best of Antic (Antic Magazine) ADS0010
[*]DOS Disk #1: 9 Public Domain DOS's (Portland Atari Club)
[*]Express! 850 Modem Program (Portland Atari Club)
[*]XL Translator (Portland Atari Club)
[*]MACE diskettes – Catalog 1, 2, 3; Captive & Number Games (Disk G-64)
[*]PACE Library – 6/92
[*]Pantheon v 2.0 (aka PanView) – NWPAC Disk of the Month, Nov '92
[*]Pot of Gold (Alamo Area Atari Users Assn., San Antonio, TX)
[/list]

[u]SOFTWARE – Cassette Tapes[/u]

[u]Games, Creativity, Educational[/u]
[list]

[*]Empire of the Overmind (Microcomputer Games) – w/ manual (in orig. pkg.)
[*]Conversational Spanish (Atari, Longman/EMI) – w/ manual (in orig. pkg.)
[*]Turtle Tracks (Scholastic Wizware) – w/ manual (in orig. pkg.)

[*]747 Landing Simulator (Atari Program Exchange) – w/ manual (in orig. pkg.)
[*]Pirate Adventure, Scott Adams Adventure #2 (Adventure International) – w/ manual (in orig. pkg.)
[*]Pyramid of Doom, Scott Adams Adventure #8 (Adventure International) – w/ manual (in orig. pkg.)
[*]Golden Voyage, Scott Adams Adventure #12 (Adventure International) – w/ manual (in orig. pkg.)
[*]Blackjack Casino (Atari Program Exchange) – w/ manual
[*]Nautilus (Synapse) – w/ manual
[*]Legionnaire (Microcomputer Games) – w/ manual
[*]Square Pairs (Scholastic Wizware) – no manual, (in orig. pkg.)
[*]Journey to the Planets (JV Software) – no manual
[*]Kingdom (Atari) – no manual
[*]Dice Poker (Atari Program Exchange) – no manual
[*]Temple of Apshai (Epyx) – no manual
[*]Solo Flight (Microprose) – no manual
[/list]

[u]Utilities, Programming, Miscellaneous[/u]
[list]

[*]Writing Programs One (Atari) – no manual
[*]Writing Programs Two (Atari) – no manual
[/list]

[u]PUBLICATIONS[/u]

[u]Books[/u]

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

I'm not sure that I understand the point. You're going to host
a newsgroup or groups via HTTP instead of NNTP? Why not just host an
actual Atari BBS via emulator? That way you could put up some
ATASCII/ASCII games to play. Otherwise just run your own NNTP server.
(like the makers of elinks did)

And anyway, you have to sign up just to read the message boards? I'm not
going to go through the effort of doing that just to preview the boards
so that I know whether I want to sign up or delete my newly created
account. Plus even the login page utilises TABLEs. I can only imagine
the TABLE hell that I would endure once I "got in".
(but, then again, most HTML BBSes are TABLE hells)
OAnd it seems to like to use explicit tags like B when it should be
using implicit tags like EM (or STRONG).

I can't understand why anyone would want to use a HTML BBS. NNTP lets
your newsreader sort and arrange message lists to your heart's content.
You can see the list of articles sorted by subject or just see a list
sorted purely by date.
(useful for very low volume groups)
And, of course, it (the newsreader) keeps track of what messages have
been read or not.

And last but not least; why should we leave this newsgroup at all. It's
a public newsgroup that everyone should become aware of the moment they
type "*atari*" into their newsreader. So this is the natural forum to
make everyone's main focus so as not to splinter the Atari community. It
literally needs no advertising.

>I can't understand why anyone would want to use a HTML BBS. NNTP lets
>your newsreader sort and arrange message lists to your heart's content.

Which is great if you use NNTP. Let's face it, the overwhelming
majority of casual net users (and even dedicated net users) don't even
know what NNTP is. An HTML web site is still the way to go if you want
to involve a majority of interested people in an Atari discussion. By
limiting the discussion to the newsgroups you will always have access
to the six or seven regulars who check in daily - don't, however,
expect ot get much in the way of a wide-ranging discussion about
anything.

Ironically I think it is the "wide-ranging discussion" that got KJ to act. Yeap, NNTP has its flaws: No binaries, no images, et cetera. On the other hand NNTP and Doc's bbs are the last places you can connect with a real Atari. Probably not a frequently required perk but still kind of neat in its own way.

To a large extent the web boards are a bit of an illusion. For instance we traditionally honor intellectual property rights here so pirated software was frowned upon. We also are mostly non commercial once again from tradition that dates back to when NNTP was run on college computers and it ads weren't allowed. Ever go to a party where people only talk in their little circle of friends? You put [anti piracy, pirates, non commercial, commercial, hankie fighters, why can't we all just get along?, ...] together in the same room you end up with a full room of people that aren't relating to each other.

There are other traditions that certainly predate my presence here. You would have to go back to the Cleveland Freenet and do some digging. I'm comfortable with the existance of NNTP and the few bbs's that remain. Kind of a secure feeling.

I'm not saying that NNTP is a "bad" or "worse" forum for discussion,
what I am saying is that it is very much unknown to the vast majority
of online users and has a (very) limited discussion population.

Yes, web-based forums leave themselves open to abuse. But still,
that's where the people are.

It's hard not to use personal examples to agree with you. If you get here from google groups, there are ~288 c.s.a.8 members using their interface, me too. I started an SMF based board about ~2 months ago so I'd have a place to post personal junk and so far I have had to BAN over 1,200 users and have 400 members who haven't given me reason to ban them yet. I figure 90% of them are bots or spiders. That's certainly where the people are and abuse is rampant.

Here in eastern Pennsylvania I take the Reading Eagle newspaper. It's a pretty good sized-town and the paper is a typical large-town paper. Last year they went to a web-based feedback forum to make it easier and faster for people to respond and communicate with them. Last week they stopped the service because of "rampant hate-mail and racist abuse."

I dunno. Sign of the culture perhaps. The easier technology makes it to communicate, the more people have to screw it up. Damn shame though.

Dave.

Yes - because it depends on what you need. ABC does not compile to assembly, but to a p-code which is then interpreted. The second problem is that ABC only supports integers (24 bit integers, specifically), and thus any type of floating point math is out. For many applications, this is enough, but not for all.
The advantage of ABC is that you can reconstruct the basic program from the pCode, thus de-compilers are available. It was also commercially successful, a couple of Microprose games have been compiled with it.

If you need floating point, well, the TurboBasic compiler wasn't bad, it just required a larger runtime.

So long,
Thomas

IF you just want to compile straight Atari BASIC code, I had the MMG compiler and thought it was quite good. It has the option of compiling either floating point or integer. You could also save the assember source code but it wasn't very useful except to see how they did their magic. I seem to recall the MMG was a derivative of another, maybe even the ABC. You really needed a double density disk ~180 of storage to do anything useful with it though. I compiled some terminal programs with it and had no trouble getting 2400 BAUD from a compiled BASIC program.

SMF => Simple Machines Forum just a prerolled message forum. Kind of
like the Red Hat of forums.

http://www.ataricorpse.com/

Yes, I have a black sense of humor that you may not find funny.<grin>
By my own admission it's pretty sucky excuse for web space. There are
excuses and there are reasons. Mostly fortunate time burner reasons
like grandkids birthday parties but it takes time away from coding and
soldering to ban 1200 people!

Hello:

There are a few basic compilers out, like CMP and there is another one, my old mind cant remember that I have. I tried compiling games or compiled a Sieve of The Greek guy(I am a bad speller) and it made some work a lot faster but mad some games so fast they were not playable. So find a Sieve program and compile it and see what makes things run faster. Other than that if you are looking for compilers, let me know, I can make Atari Image Files of any of them.

I love my APE interface

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Just saw this fly past the Yahoo! News alerts:

PC World, Fri, 16 Jul 2010 14:52 PM PDT
Atari to Cannibalize Back Catalog for Remakes of Classic Games http://www.pcworld.com/article/201305/atari_to_cannibalize_back_catalog_for_remakes.html?tk=rss_news
The company is remaking the Atari 2600 classic Haunted House
--
-Bill can updates of Centipede and Star Raiders be far behind? Star Raiders - Atari - Atari 2600 - Video game - Centipede

1up.com, Fri, 16 Jul 2010 10:04 AM PDT
Atari Remakes for Centipede, Star Raiders May Be Coming
http://www.1up.com/do/newsStory?cId=3180426
After announcing that it would resurrect the Haunted House franchise, it now looks as if Atari may have some other retro revivals up its sleeve. Listings for Star Raiders and Centipede have both popped up on GameFly (via Joystiq , Siliconera), suggesting that the two games may each be in line for some sort of remake or revival. Both games were released around the same time as Haunted House ...

Joystiq, Fri, 16 Jul 2010 02:13 AM PDT
Gamefly listings suggest Centipede and Star Raiders remakes http://www.joystiq.com/2010/07/16/gamefly-listings-suggest-centipede-and-star-raiders-remakes/
[Star Raiders Tribute Page] It would appear that Haunted House marked the beginning of a new series of revamped Atari classics. Siliconera spotted GameFly listings for PS3 and Xbox 360 games called " Star Raiders " and " Centipede ." Centipede , of course, is one of the most well-known early arcade games, featuring a trackball-controlled avatar firing lasers at on-screen centipedes and ...

And hey cool, that last one points to my SR Tribute page
that I made ... wow... 14 years ago?! 8^o

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=180543091231&ssPageName=STRK:MESELX:IT

Perfect for the Atari 800 enthusiast's collection. This is a 132 page
book detailing the Atari 800.
Published in 1982 as a reference guide for sales associates. The book
is in very good condition for
its age. Thanks for your interest.

Last-modified: April 26, 2010

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.
